

Control User Guide

Unidrive M700 Unidrive M701 Unidrive M702

Universal Variable Speed AC drive for induction and permanent magnet motors

Part Number: 0478-0353-02 Issue: 2

Original Instructions

For the purposes of compliance with the EU Machinery Directive 2006/42/EC, the English version of this manual is the Original Instructions. Manuals in other languages are Translations of the Original Instructions.

Documentation

Manuals are available to download from the following locations: http://www.drive-setup.com/ctdownloads

The information contained in this manual is believed to be correct at the time of printing and does not form part of any contract. The manufacturer reserves the right to change the specification of the product and its performance, and the contents of the manual, without notice.

Warranty and Liability

In no event and under no circumstances shall the manufacturer be liable for damages and failures due to misuse, abuse, improper installation, or abnormal conditions of temperature, dust, or corrosion, or failures due to operation outside the published ratings. The manufacturer is not liable for consequential and incidental damages. Contact the supplier of the dive for full details of the warranty terms.

Environmental policy

Control Techniques Ltd operates an Environmental Management System (EMS) that conforms to the International Standard ISO 14001.

Further information on our Environmental Policy can be found at: http://www.drive-setup.com/environment

Restriction of Hazardous Substances (RoHS)

The products covered by this manual comply with European and International regulations on the Restriction of Hazardous Substances including EU directive 2011/65/EU and the Chinese Administrative Measures for Restriction of Hazardous Substances in Electrical and Electronic Products.

Disposal and Recycling (WEEE)

When electronic products reach the end of their useful life, they must not be disposed of along with domestic waste but should be recycled by a specialist recycler of electronic equipment. Control Techniques products are designed to be easily dismantled into their major component parts for efficient recycling. The majority of materials used in the product are suitable for recycling.

Product packaging is of good quality and can be re-used. Large products are packed in wooden crates. Smaller products are packaged in strong cardboard cartons which have a high recycled fibre content. Cartons can be re-used and recycled. Polythene, used in protective film and bags for wrapping the product, can be recycled. When preparing to recycle or dispose of any product or packaging, please observe local legislation and best practice.

REACH legislation

EC Regulation 1907/2006 on the Registration, Evaluation, Authorisation and restriction of Chemicals (REACH) requires the supplier of an article to inform the recipient if it contains more than a specified proportion of any substance which is considered by the European Chemicals Agency (ECHA) to be a Substance of Very High Concern (SVHC) and is therefore listed by them as a candidate for compulsory authorisation.

Further information on our compliance with REACH can be found at: http://www.drive-setup.com/reach

Registered Office

Nidec Control Techniques Ltd The Gro Newtown Powys SY16 3BE UK Registered in England and Wales. Company Reg. No. 01236886.

Copyright

The contents of this publication are believed to be correct at the time of printing. In the interests of a commitment to a policy of continuous development and improvement, the manufacturer reserves the right to change the specification of the product or its performance, or the contents of the guide, without notice.

How to use this guide

This guide is intended to be used in conjunction with the appropriate *Power Installation Guide*. The *Power Installation Guide* gives information necessary to physically install the drive. This guide gives information on drive configuration, operation and optimization.

NOTE

There are specific safety warnings throughout this guide, located in the relevant sections. In addition, Chapter 1 *Safety information* contains general safety information. It is essential that the warnings are observed and the information considered when working with or designing a system using the drive.

This map of the user guide helps to find the right sections for the task you wish to complete, but for specific information, refer to *Contents* on page 4:

EU Declaration of Conformity

Nidec Control Techniques Ltd

The Gro

Newtown

Powys

SY16 3BE

UK

This declaration is issued under the sole responsibility of the manufacturer. The object of the declaration is in conformity with the relevant European Union harmonization legislation. The declaration applies to the variable speed drive products shown below:

Model number	Interpretation	Nomenclature aaaa - bbc ddddde
aaaa	Basic series	M100, M101, M200, M201, M300, M400, M600, M700, M701, M702, M708, M709, M751, M753, M754, F300, H300, E200, E300, HS30, HS70, HS71, HS72, M000, RECT
bb	Frame size	01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11
С	Voltage rating	1 = 100 V, 2 = 200 V, 4 = 400 V, 5 = 575 V, 6 = 690 V
ddddd	Current rating	Example 01000 = 100 A
е	Drive format	A = 6P Rectifier + Inverter (internal choke), D = Inverter, E = 6P Rectifier + Inverter (external choke), T = 12P Rectifier + Inverter (external choke)

The model number may be followed by additional characters that do not affect the ratings.

The variable speed drive products listed above have been designed and manufactured in accordance with the following European harmonized standards:

EN 61800-5-1:2007	Adjustable speed electrical power drive systems - Part 5-1: Safety requirements - Electrical, thermal and energy
EN 61800-3: 2004+A1:2012	Adjustable speed electrical power drive systems - Part 3: EMC requirements and specific test methods
EN 61000-6-2:2005	Electromagnetic compatibility (EMC) - Part 6-2: Generic standards - Immunity for industrial environments
EN 61000-6-4: 2007+ A1:2011	Electromagnetic compatibility (EMC) - Part 6-4: Generic standards - Emission standard for industrial environments
EN 61000-3-2:2014	Electromagnetic compatibility (EMC) - Part 3-2: Limits for harmonic current emissions (equipment input current ≤16 A per phase)
EN 61000-3-3:2013	Electromagnetic compatibility (EMC) - Part 3-3: Limitation of voltage changes, voltage fluctuations and flicker in public, low voltage supply systems, for equipment with rated current ≤16 A per phase and not subject to conditional connection

EN 61000-3-2:2014 Applicable where input current < 16 A. No limits apply for professional equipment where input power ≥1 kW.

These products comply with the Restriction of Hazardous Substances Directive (2011/65/EU), the Low Voltage Directive (2014/35/EU) and the Electromagnetic Compatibility Directive (2014/30/EU).

(sign willes

G Williams Vice President, Technology Date: 6th September 2017

These electronic drive products are intended to be used with appropriate motors, controllers, electrical protection components and other equipment to form complete end products or systems. Compliance with safety and EMC regulations depends upon installing and configuring drives correctly, including using the specified input filters.

The drives must be installed only by professional installers who are familiar with requirements for safety and EMC. Refer to the Product Documentation. An EMC data sheet is available giving detailed information. The assembler is responsible for ensuring that the end product or system complies with all the relevant laws in the country where it is to be used.

EU Declaration of Conformity (including 2006 Machinery Directive)

Nidec Control Techniques Ltd

The Gro

Newtown

This declaration is issued under the sole responsibility of the manufacturer. The object of the declaration is in conformity with the relevant Union harmonization legislation. The declaration applies to the variable speed drive products shown below:

Model No.	Interpretation	Nomenclature aaaa - bbc ddddde
aaaa	Basic series	M600, M700, M701, M702, M708, M709, M751, M753, M754, F300, H300, E200, E300, HS70, HS71, HS72, M000, RECT
bb	Frame size	01, 02, 03, 04, 05, 06, 07, 08, 09, 10, 11
С	Voltage rating	1 = 100 V, 2 = 200 V, 4 = 400 V, 5 = 575 V, 6 = 690 V
ddddd	Current rating	Example 01000 = 100 A
е	Drive format	A = 6P Rectifier + Inverter (internal choke), D = Inverter, E = 6P Rectifier + Inverter (external choke), T = 12P Rectifier + Inverter (external choke)

The model number may be followed by additional characters that do not affect the ratings.

This declaration relates to these products when used as a safety component of a machine. Only the Safe Torque Off function may be used for a safety function of a machine. None of the other functions of the drive may be used to carry out a safety function.

These products fulfil all the relevant provisions of the Machinery Directive 2006/42/EC and the Electromagnetic Compatibility Directive (2014/30/EU). EC type examination has been carried out by the following notified body:

TUV Rheinland Industrie Service GmbH

Am Grauen Stein

D-51105 Köln

Germany

Notified body identification number: 0035

The harmonized standards used are shown below: EC type-examination certificate numbers: 01/205/5270.02/17 dated 2017-08-28

EN 61800-5-1:2016	Adjustable speed electrical power drive systems - Part 5-2: Safety requirements - Functional

IMPORTANT NOTICE

These electronic drive products are intended to be used with appropriate motors, controllers, electrical protection components and other equipment to form complete end products or systems. It is the responsibility of the installer to ensure that the design of the complete machine, including its safety-related control system, is carried out in accordance with the requirements of the Machinery Directive and any other relevant legislation. The use of a safety-related drive in itself does not ensure the safety of the machine. Compliance with safety and EMC regulations depends upon installing and configuring drives correctly, including using the specified input filters. The drive must be installed only by professional installers who are familiar with requirements for safety and EMC. The assembler is responsible for ensuring that the end product or system complies with all relevant laws in the country where it is to be used. For more information regarding Safe Torque Off, refer to the Product Documentation.

1 Safety information

1.1 Warnings, Cautions and Notes

A Warning contains information which is essential for avoiding a safety hazard.

A Caution contains information which is necessary for avoiding a risk of damage to the product or other equipment.

NOTE

A Note contains information which helps to ensure correct operation of the product.

1.2 Important safety information. Hazards. Competence of designers and installers

This guide applies to products which control electric motors either directly (drives) or indirectly (controllers, option modules and other auxiliary equipment and accessories). In all cases the hazards associated with powerful electrical drives are present, and all safety information relating to drives and associated equipment must be observed.

Specific warnings are given at the relevant places in this guide.

Drives and controllers are intended as components for professional incorporation into complete systems. If installed incorrectly they may present a safety hazard. The drive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control equipment which can cause injury. Close attention is required to the electrical installation and the system design to avoid hazards either in normal operation or in the event of equipment malfunction. System design, installation, commissioning/start-up and maintenance must be carried out by personnel who have the necessary training and competence. They must read this safety information and this guide carefully.

1.3 Responsibility

It is the responsibility of the installer to ensure that the equipment is installed correctly with regard to all instructions given in this guide. They must give due consideration to the safety of the complete system, so as to avoid the risk of injury both in normal operation and in the event of a fault or of reasonably foreseeable misuse.

The manufacturer accepts no liability for any consequences resulting from inappropriate, negligent or incorrect installation of the equipment.

1.4 Compliance with regulations

The installer is responsible for complying with all relevant regulations, such as national wiring regulations, accident prevention regulations and electromagnetic compatibility (EMC) regulations. Particular attention must be given to the cross-sectional areas of conductors, the selection of fuses or other protection, and protective ground (earth) connections.

This guide contains instructions for achieving compliance with specific EMC standards.

All machinery to be supplied within the European Union in which this product is used must comply with the following directives:

2006/42/EC Safety of machinery.

2014/30/EU: Electromagnetic Compatibility.

1.5 Electrical hazards

The voltages used in the drive can cause severe electrical shock and/or burns, and could be lethal. Extreme care is necessary at all times when working with or adjacent to the drive. Hazardous voltage may be present in any of the following locations:

- AC and DC supply cables and connections
- Output cables and connections
- Many internal parts of the drive, and external option units

Unless otherwise indicated, control terminals are single insulated and must not be touched.

The supply must be disconnected by an approved electrical isolation device before gaining access to the electrical connections.

The STOP and Safe Torque Off functions of the drive do not isolate dangerous voltages from the output of the drive or from any external option unit.

The drive must be installed in accordance with the instructions given in this guide. Failure to observe the instructions could result in a fire hazard.

1.6 Stored electrical charge

The drive contains capacitors that remain charged to a potentially lethal voltage after the AC supply has been disconnected. If the drive has been energized, the AC supply must be isolated at least ten minutes before work may continue.

1.7 Mechanical hazards

Careful consideration must be given to the functions of the drive or controller which might result in a hazard, either through their intended behaviour or through incorrect operation due to a fault. In any application where a malfunction of the drive or its control system could lead to or allow damage, loss or injury, a risk analysis must be carried out, and where necessary, further measures taken to reduce the risk - for example, an over-speed protection device in case of failure of the speed control, or a fail-safe mechanical brake in case of loss of motor braking.

With the sole exception of the Safe Torque Off function, none of the drive functions must be used to ensure safety of personnel, i.e. they must not be used for safety-related functions.

The Safe Torque Off function may be used in a safety-related application. The system designer is responsible for ensuring that the complete system is safe and designed correctly according to the relevant safety standards.

The design of safety-related control systems must only be done by personnel with the required training and experience. The Safe Torque Off function will only ensure the safety of a machine if it is correctly incorporated into a complete safety system. The system must be subject to a risk assessment to confirm that the residual risk of an unsafe event is at an acceptable level for the application.

1.8 Access to equipment

Access must be restricted to authorized personnel only. Safety regulations which apply at the place of use must be complied with.

1.9 Environmental limits

Instructions in this guide regarding transport, storage, installation and use of the equipment must be complied with, including the specified environmental limits. This includes temperature, humidity, contamination, shock and vibration. Drives must not be subjected to excessive physical force.

1.10 Hazardous environments

The equipment must not be installed in a hazardous environment (i.e. a potentially explosive environment).

Safety information Product installation Mechanical installation Electrical installation Getting started Basic parameters Running the motor Optimization Drive communication NV Media Card Operation Onboard PLC Advanced parameters	Diagnostics ir	UL information
--	----------------	-------------------

1.11 Motor

The safety of the motor under variable speed conditions must be ensured.

To avoid the risk of physical injury, do not exceed the maximum specified speed of the motor.

Low speeds may cause the motor to overheat because the cooling fan becomes less effective, causing a fire hazard. The motor should be installed with a protection thermistor. If necessary, an electric forced vent fan should be used.

The values of the motor parameters set in the drive affect the protection of the motor. The default values in the drive must not be relied upon. It is essential that the correct value is entered in the Motor Rated Current parameter.

1.12 Mechanical brake control

Any brake control functions are provided to allow well co-ordinated operation of an external brake with the drive. While both hardware and software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury, independent protection devices of proven integrity must also be incorporated.

1.13 Adjusting parameters

Some parameters have a profound effect on the operation of the drive. They must not be altered without careful consideration of the impact on the controlled system. Measures must be taken to prevent unwanted changes due to error or tampering.

1.14 Electromagnetic compatibility (EMC)

Installation instructions for a range of EMC environments are provided in the relevant Power Installation Guide. If the installation is poorly designed or other equipment does not comply with suitable standards for EMC, the product might cause or suffer from disturbance due to electromagnetic interaction with other equipment. It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with the relevant EMC legislation in the place of use.

2 Product information

2.1 Introduction

Universal AC and servo drive

This product family consists of Unidrive M700, Unidrive M701 and Unidrive M702, these deliver maximum machine performance.

Common features (Unidrive M700, 701 and 702)

- · Universal high performance open and closed loop control for induction, servo, permanent magnet and linear motors
- · Automation and motion option module for direct migration of SyPTPro / SM-Applications programs
- Onboard IEC 61131-3 programmable automation and motion control
- · Flexibility with speed and position measurement, supporting multiple devices and all common interfaces
- NV Media Card for parameter copying and data storage

Optional features (Unidrive M700, 701 and 702)

• Select up to three option modules including programmable automation and motion control.

Unidrive M700

- Ethernet fieldbus communications
- Single channel Safe Torque Off (STO) input

Unidrive M701

- · Provides a direct replacement / upgrade for Unidrive SP
- EIA 485 serial communications interface
- · Single channel Safe Torque Off (STO) input

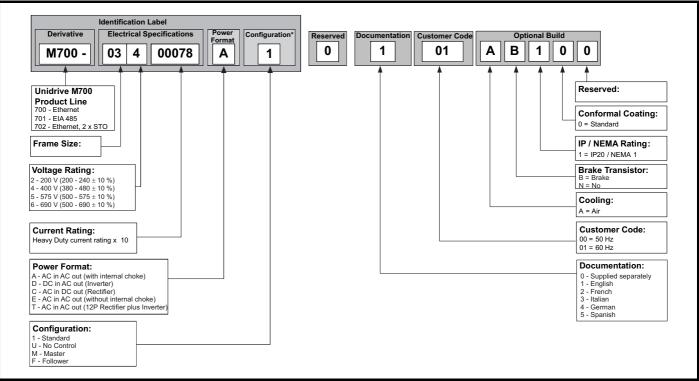

Unidrive M702

- Ethernet fieldbus communications
- Dual channel Safe Torque Off (STO) input

2.2 Model number

The way in which the model numbers for the Unidrive M700 range are formed is illustrated below:

Figure 2-1 Model number

* Only shown on Frame size 9, 10 and 11 identification label.

NOTE

For simplicity a Frame 9 drive with no internal choke (i.e. model 09xxxxxE) is referred to as a Frame 9E and a Frame 9 drive with an internal choke (i.e. model 09xxxxxA) is referred to as a Frame 9A. Any reference to Frame 9 is applicable to both sizes 9E and 9A.

2.4 Operating modes

The drive is designed to operate in any of the following modes:

1. Open loop mode

```
Open loop vector mode
Fixed V/F mode (V/Hz)
```

Quadratic V/F mode (V/Hz)

2. RFC - A

With position feedback sensor

Without position feedback sensor (Sensorless)

3. RFC - S

With position feedback sensor

Without position feedback sensor (Sensorless)

4. Regen mode

2.4.1 Open loop mode

The drive applies power to the motor at frequencies varied by the user. The motor speed is a result of the output frequency of the drive and slip due to the mechanical load. The drive can improve the speed control of the motor by applying slip compensation. The performance at low speed depends on whether V/F mode or open loop vector mode is selected.

Open loop vector mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where the drive uses motor parameters to apply the correct voltage to keep the flux constant under varying load conditions.

Typically 100 % torque is available down to 1 Hz for a 50 Hz motor.

Fixed V/F mode

The voltage applied to the motor is directly proportional to the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for multi-motor applications.

Typically 100 % torque is available down to 4 Hz for a 50 Hz motor.

Quadratic V/F mode

The voltage applied to the motor is directly proportional to the square of the frequency except at low speed where a voltage boost is provided which is set by the user. This mode can be used for running fan or pump applications with quadratic load characteristics or for multi-motor applications. This mode is not suitable for applications requiring a high starting torque.

2.4.2 RFC-A mode

Rotor Flux Control for Asynchronous (induction) motors (RFC-A) encompasses closed loop vector control with a position feedback device

With position feedback

For use with induction motors with a feedback device installed. The drive directly controls the speed of the motor using the feedback device to ensure the rotor speed exactly as demanded. Motor flux is accurately controlled at all times to provide full torque all the way down to zero speed.

Without position feedback (Sensorless)

Sensorless mode provides closed loop control without the need for position feedback by using current, voltages and key motor parameters to estimate the motor speed. It can eliminate instability traditionally associated with open loop control such as operating large motors with light loads at low frequencies.

2.4.3 RFC- S mode

Rotor Flux Control for Synchronous (permanent magnet brushless) motors (RFC-S) provides closed loop control with position feedback device.

With position feedback

For use with permanent magnet brushless motors with a feedback device installed.

The drive directly controls the speed of the motor using the feedback device to ensure the rotor speed is exactly as demanded. Flux control is not required because the motor is self excited by the permanent magnets which form part of the rotor.

Absolute position information is required from the feedback device to ensure the output voltage is accurately matched to the back EMF of the motor. Full torque is available all the way down to zero speed.

Without position feedback

For use with permanent magnet brushless motors without a feedback device installed.

Flux control is not required because the motor is self excited by the permanent magnets which form part of the rotor.

Full torque is available all the way down to zero speed, with salient motors.

2.4.4 Regen mode

For use as a regenerative front end for four quadrant operation.

Regen operation allows bi-directional power flow to and from the AC supply. This provides far greater efficiency levels in applications which would otherwise dissipate large amounts of energy in the form of heat in a braking resistor.

The harmonic content of the input current is negligible due to the sinusoidal nature of the waveform when compared to a conventional bridge rectifier or SCR/thyristor front end.

NOTE

Contact the supplier of the drive for further information.

2.6 Nameplate description

* This label is only applicable to Size 7 and above.

Refer to Figure 2-1 Model number on page 11 for further information relating to the labels.

Date code format

The date code consists of four numbers, the first two numbers indicate the year and the remaining two numbers indicate the week of the year in which the drive was built.

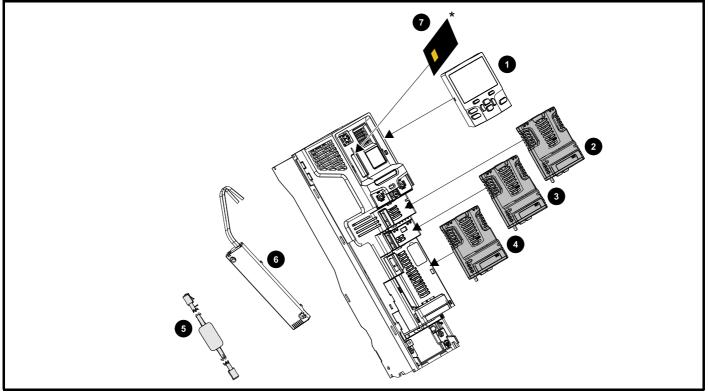

Example:

A date code of 1714 would correspond to week 14 of the year 2017.

2.7 Options

Figure 2-3 Options available with the drive

- 1. Keypad
- 2. Option module slot 1
- 3. Option module slot 2
- 4. Option module slot 3
- 5. CT USB Comms cable
- 6. Internal braking resistor (available on size 3, 4 and 5)
- 7. NV media card

* For further information, refer to Chapter 10 NV Media Card Operation on page 139.

Unidrive M option modules come in two different formats, a standard option module and a large option module. All standard option modules are colorcoded in order to make identification easy, whereas the larger option module is black. All modules have an identification label on top of the module. Standard option modules can be installed to any of the available option slots on the drive, whereas the large option modules can only be installed to option slot 3. The following tables shows the color-code key and gives further details on their function.

3 Mechanical installation

3.1 Installing / removing option modules and keypads

Power down the drive before installing / removing the option module. Failure to do so may result in damage to the product.

Figure 3-1 Installation of a standard option module

CAUTION

Installing the first option module

NOTE

Option module slots must be used in the following order: slot 3, slot 2 and slot 1 (refer to section 2.7 Options on page 16 for slot numbers).

- Move the option module in direction shown (1).
- Align and insert the option module tab in to the slot provided (2), this is highlighted in the detailed view (A).
- Press down on the option module until it clicks into place.

Installing the second option module

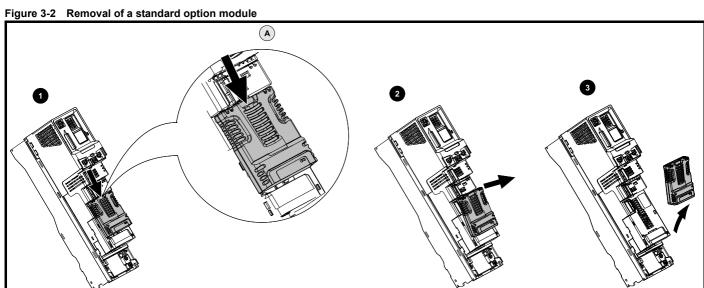

- Move the option module in direction shown (3).
- Align and insert the option module tab in to the slot provided on the already installed option module (4), this is highlighted in the detailed view (B).
- Press down on the option module until it clicks into place. Image (5) shows two option modules fully installed.

Installing the third option module

Repeat the above process.

The drive has the facility for all three option module slots to be used at the same time, image (6) shows the three option modules installed.

	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
--	-----------------------	------------------------	-------------------------	----------------------------	--------------------	---------------------	----------------------	--------------	------------------------	----------------------------	----------------	------------------------	-------------	-------------------

• Press down on the tab (1) to release the option module from the drive housing, the tab is highlighted in the detailed view (A).

- Tilt the option module towards you as shown (2).
- Totally remove the option module in direction shown (3).

Figure 3-3 Installation and removal of a large option module

Installing a large option module

- Move the option module in direction shown (1).
- Align and insert the option module tabs (A) into the slot provided (B).
- Press down on the option module until it clicks into place.

Removing a large option module

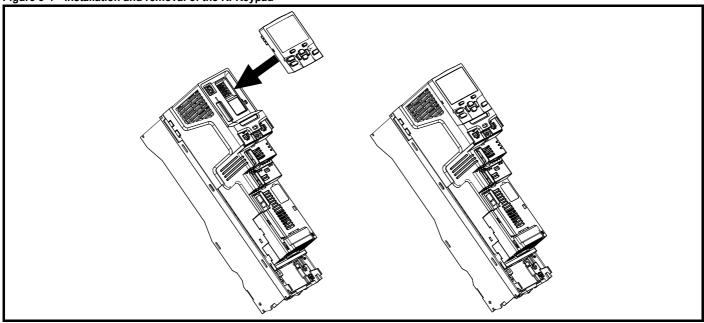

• Press down on the tab (2C), tilt the option module towards you and remove.

NOTE

The large option module can only be inserted into slot 3. Additional standard option modules can still be installed and used in slot 2 and slot 1.

	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
--	-----------------------	------------------------	-------------------------	----------------------------	-----------------	---------------------	----------------------	--------------	------------------------	----------------------------	----------------	------------------------	-------------	-------------------

Figure 3-4 Installation and removal of the KI-Keypad

To install, align the keypad and press gently in the direction shown until it clicks into position.

To remove, reverse the installation instructions.

NOTE

The keypad can be installed / removed while the drive is powered up and running a motor, providing that the drive is not operating in keypad mode.

3.2 Real time clock battery replacement

Those keypads which have the real time clock feature contain a battery to ensure the clock works when the drive is powered down. The battery has a long life time but if the battery needs to be replaced or removed, follow the instructions below.

Low battery voltage is indicated by 📋 low battery symbol on the keypad display.

Figure 3-5 KI-Keypad RTC (rear view)

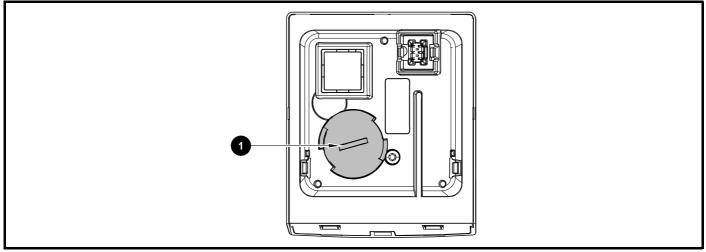

Figure 3-5 above illustrates the rear view of the KI-Keypad RTC.

- 1. To remove the battery cover insert a flat head screwdriver into the slot as shown (1), push and turn anti-clockwise until the battery cover is released.
- 2. Replace the battery (the battery type is: CR2032).
- 3. Reverse point 1 above to replace battery cover.

NOTE

Ensure the battery is disposed of correctly.

--------------	--

4 Electrical installation

4.1 24 Vdc supply

The 24 Vdc supply connected to control terminals 1 & 2 provides the following functions:

- It can be used to supplement the drive's own internal 24 V supply when multiple option modules are being used and the current drawn by these module is greater than the drive can supply.
- It can be used as a back-up power supply to keep the control circuits of the drive powered up when the line power supply is removed. This allows any fieldbus modules, application modules, encoders or serial communications to continue to operate.
- It can be used to commission the drive when the line power supply is not available, as the display operates correctly. However, the drive will be in the Under voltage trip state unless either line power supply or low voltage DC operation is enabled, therefore diagnostics may not be possible. (Power down save parameters are not saved when using the 24 V back-up power supply input).
- If the DC bus voltage is too low to run the main SMPS in the drive, then the 24 V supply can be used to supply all the low voltage power requirements of the drive. Low Under Voltage Threshold Select (06.067) must also be enabled for this to happen.

NOTE

On size 6 and larger, the power 24 Vdc supply (terminals 51, 52) must be connected to enable the 24 V dc supply to be used as a backup supply, when the line power supply is removed. If the power 24 Vdc supply is not connected none of the above mentioned functions can be used, "Waiting For Power Systems" will be displayed on the keypad and no drive operations are possible. The location of the power 24 Vdc can be identified from Figure 4-1 *Location of the 24 Vdc power supply connection on size 6* on page 22.

Table 4-1 24 Vdc Supply connection	pply connections	√dc	24	4-1	Table
------------------------------------	------------------	-----	----	-----	-------

Function	Sizes 3-5	Sizes 6-11
Supplement the drive's internal supply	Terminal 1, 2	Terminal 1, 2
Back-up supply for the control circuit	Terminal 1, 2	Terminal 1, 2 51, 52

The working voltage range of the control 24 V power supply is as follows:

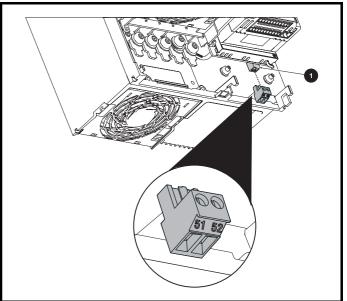

1	0V (Common connection for all exte	ernal devices)
2	+24 Vdc	
Nomina	operating voltage	24.0 Vdc
Minimur	n continuous operating voltage	19.2 V
Maximu	m continuous operating voltage	28.0 V
Minimur	n start up voltage	21.6 V
Maximu	m power supply requirement at 24 V	40 W
Recomm	nended fuse	3 A, 50 Vdc

Minimum and maximum voltage values include ripple and noise. Ripple and noise values must not exceed 5 %.

The working range of the 24 V power supply is as follows:

51 0V (Common connection for all ex	ternal devices)
52 +24 Vdc	
Size 6	
Nominal operating voltage	24.0 Vdc
Minimum continuous operating voltage	18.6 Vdc
Maximum continuous operating voltage	28.0 Vdc
Minimum startup voltage	18.4 Vdc
Maximum power supply requirement	40 W
Recommended fuse	4 A @ 50 Vdc
Size 7 to 11	
Nominal operating voltage	24.0 Vdc
Minimum continuous operating voltage	19.2 Vdc
Maximum continuous operating voltage	30 Vdc (IEC), 26 Vdc (UL)
Minimum startup voltage	21.6 Vdc
Maximum power supply requirement	60 W
Recommended fuse	4 A @ 50 Vdc

Figure 4-2 Location of the 24 Vdc power supply connection on size 7

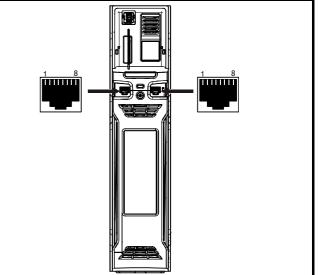

4.2 Communication connections

The *Unidrive M700 / M702* drive offers Ethernet fieldbus communications and the *Unidrive M701* drive offers a 2 wire EIA 485 interface. This enables the drive set-up, operation and monitoring to be carried out with a PC or controller if required.

Care must be taken to ensure the correct interface is fitted before a connection is made to the interface, failure to ensure this may result in damage to the interface and/or communication device.

Both the Ethernet and EIA 485 interfaces use an RJ45 connector, the EIA 485 interface is identified by the number "485" printed on the front panel, and the Ethernet interface has the network logo.

4.2.1 *Unidrive M700 / M702* Ethernet fieldbus communications

The Ethernet option provides two RJ45 connections with an Ethernet switch for easy network creation.

Standard UTP (unshielded twisted pair) or STP (shielded twisted pair) cables are supported. It is recommended that a minimum specification CAT5e is used in new installations. As the drive supports the 'Auto cross-over detection' a cross-over cable is not required.

NOTE

The shell of the RJ45 connector is isolated from the 0V of the drive control terminals but it is connected to ground.

Table 4	-2 E	Ethernet	port	pin-outs
---------	------	----------	------	----------

Pin	Description
1	Transmit +
2	Transmit -
3	Receive +
4	N/A
5	N/A
6	Receive -
7	N/A
8	N/A

4.2.2 Unidrive M701 EIA 485 serial communications

The EIA 485 interface provides two parallel RJ45 connectors allowing easy daisy chaining. The drive only supports Modbus RTU protocol. See Table 4-3 for the connection details.

Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
Information	information	mstanation	matanation	Stanteu	parameters	the motor		communication	Operation	1 20	parameters		monnation

NOTE

Standard Ethernet cables are not recommended for use when connecting drives on a EIA 485 network as they do not have the correct twisted pairs for the pinout of the serial comms port.

If an Ethernet network adaptor is inadvertently connected to a Unidrive-M701 EIA 485 drive, a low impedance load across the EIA 485 24 V is applied and if connected for a significant CAUTION period of time can introduce the potential risk of damage.

Table 4-3 Serial communication port pin-outs

Pin	Function
1	120 Ω Termination resistor
2	RX TX
3	Isolated 0V
4	+24 V (100 mA) output
5	Isolated 0V
6	TX enable
7	RX\ TX\
8	RX\ TX\ (if termination resistors are required, link to pin 1)
Shell	Isolated 0V

Minimum number of connections are 2, 3, 7 and shield.

4.2.3 Unidrive M701 Isolation of the EIA 485 serial communications port

The serial communications port is double insulated and meets the requirements for SELV in EN 50178:1998.

In order to meet the requirements for SELV in IEC60950 (IT equipment) it is necessary for the control computer to be grounded. Alternatively, when a lap-top or similar device is used which has no provision for grounding, an isolation WARNING device must be incorporated in the communications lead.

An isolated serial communications lead has been designed to connect the drive to IT equipment (such as laptop computers), and is available from the supplier of the drive. See below for details:

Table 4-4 Isolated serial comms lead details

Part number	Description
4500-0096	CT USB Comms cable

The "isolated serial communications" lead has reinforced insulation as defined in IEC60950 for altitudes up to 3,000 m.

Communication networks and cabling 4.2.4

Any isolated signal circuit has the capability to become live through accidental contact with other conductors; as such they should always be double-insulated from live parts. The routing of network and signal wires should be done so as to avoid close proximity to mains voltage cabling.

4.2.5 Unidrive M701 EIA 485 Port polarization (biasing)

The Unidrive M701 EIA 485 serial communications port requires polarization (biasing) of the data lines.

The Modbus standard specifies that to prevent spurious triggering when there is no data being transmitted, the data lines are polarized (biased) with pull-apart resistors, one resistor from the RJ45 pin 2 connection (RX TX) to +V and the other resistor from the RJ45 pin 7 connection (/RX / TX) to 0V. These resistors should be in the range 450 to 650 Ohms and fitted in the master controller.

Unidrive M701 EIA 485 Network termination 4.2.6

When a long-distance multi-drop EIA 485 system is used with high baud rates (above 38400) it may be necessary to fit a termination resistor of 120 Ω across the transmit and receive pair in order to reduce signal reflections.

4.3 **Control connections**

Unidrive M700 / M701 control connections 4.3.1

Table 4-5 The control connections consist of:

Function	Qty	Control parameters available	Terminal number
Differential analog input	1	Mode, offset, invert, scaling	5, 6
Single ended analog input	2	Mode, offset, invert, scaling, destination	7, 8
Analog output	2	Source, scaling	9, 10
Digital input	3	Destination, invert	27, 28, 29
Digital input / output	3	Input / output mode select, destination / source, invert, logic select	24, 25, 26
Relay	1	Source, invert	41, 42
Drive enable (Safe Torque Off)	1		31
+10 V User output	1		4
+24 V User output	1	Source, invert	22
0V common	6		1, 3, 11, 21, 23, 30, 51 (size 6 and larger)
+24V External input	1	Destination, invert	2

Key:

Destination parameter:	Indicates the parameter which is being controlled by the terminal / function
Source parameter:	Indicates the parameter being output by the terminal
Mode parameter:	Analog - indicates the mode of operation of the terminal, i.e. voltage 0-10 V, current 4-20 mA etc. Digital - indicates the mode of operation of the terminal, i.e. positive / negative logic (the Drive Enable terminal is fixed in positive logic), open collector.

All analog terminal functions can be programmed in menu 7.

All digital terminal functions (including the relay) can be programmed in menu 8.

The control circuits are isolated from the power circuits in the drive by basic insulation (single insulation) only. The installer must ensure that the external control circuits are insulated from human contact by at least one layer of insulation (supplementary insulation) rated for use at the AC supply voltage.

If the control circuits are to be connected to other circuits classified as Safety Extra Low Voltage (SELV) (e.g. to a personal computer), an additional isolating barrier must be included in order to maintain the SELV classification.

If any of the digital inputs (including the drive enable input) are connected in parallel with an inductive load (i.e. contactor or motor brake) then suitable suppression (i.e. diode or varistor) should be used on the coil of the load. If no suppression is used then over voltage spikes can cause damage to the digital inputs and outputs on the drive.

Ensure the logic sense is correct for the control circuit to be used. Incorrect logic sense could cause the motor to be started unexpectedly. Positive logic is the default state for the drive.

Unidrive M700 / M701 / M702 Control User Guide Issue Number: 2

-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	----------------------	--------------	---------------------	----------------------------	----------------	------------------------	-------------	-------------------

NOTE

Any signal cables which are carried inside the motor cable (i.e. motor thermistor, motor brake) will pick up large pulse currents via the cable capacitance. The shield of these signal cables must be connected to ground close to the point of exit of the motor cable, to avoid this noise current spreading through the control system.

NOTE

The Safe Torque Off drive enable terminal is a positive logic input only. It is not affected by the setting of *Input Logic Polarity* (08.029).

NOTE

The common 0V from analog signals should, wherever possible, not be connected to the same 0V terminal as the common 0V from digital signals. Terminals 3 and 11 should be used for connecting the 0V common of analog signals and terminals 21, 23 and 30 for digital signals. This is to prevent small voltage drops in the terminal connections causing inaccuracies in the analog signals.

NOTE

A two wire motor thermistor can be connected to analog input 3 by connecting the thermistor between terminal 8 and any 0V common terminal. It is possible to connect a 4-wire thermistor to analog input 3 as shown below. Pr **07.015** and Pr **07.046** need to be set-up for the thermistor type required.

Figure 4-5 Connection for PT100, PT1000 and PT2000 thermistors

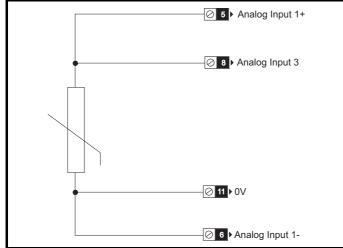

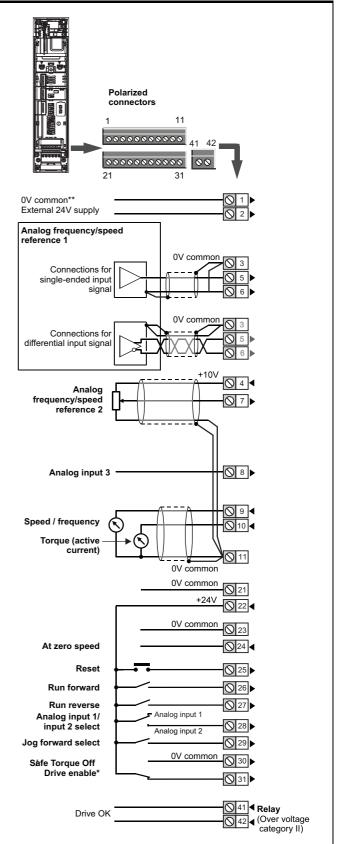

Figure 4-6 Default terminal functions

*The Safe Torque Off / Drive enable terminal is a positive logic input only.

NOTE

The 0V terminals on the Safe Torque Off are not isolated from each other and the 0V common.

4.3.3 Unidrive M702 control connections

Table 4-6 The control connections consist of:

Function	Qty	Control parameters available	Terminal number
Single ended analog input*	1	Mode, destination	8
Digital input*	2	Destination, invert, logic select	7, 8
Digital output	2	source, invert	4, 5
Relay	1	Source, invert	41, 42
Drive enable (Safe Torque Off)	2		11, 13
+24 V User output	1	Source, invert	2
0V common	5		1, 3, 6, 10, 12
+24 V External input	1	Destination, invert	9

* From date code 1710, control terminal 8 on the Unidrive M702 can be a dual-purpose input which can be configured as either a motor thermistor input (Analog Input 3) or a digital input (Digital Input 5).

Key:

Destination parameter:	Indicates the parameter which is being controlled by the terminal / function
Source parameter:	Indicates the parameter being output by the terminal
Mode parameter:	Analog - indicates the mode of operation of the thermistor protection (disabled, temperature, temperature and short).

All digital terminal functions (including the relay) can be programmed in menu 8.

The control circuits are isolated from the power circuits in the drive by basic insulation (single insulation) only. The installer must ensure that the external control circuits are insulated from human contact by at least one layer of insulation (supplementary insulation) rated for use at the AC supply voltage.

If the control circuits are to be connected to other circuits classified as Safety Extra Low Voltage (SELV) (e.g. to a personal computer), an additional isolating barrier must be included in order to maintain the SELV classification.

If any of the digital inputs (including the drive enable input) are connected in parallel with an inductive load (i.e. contactor or motor brake) then suitable suppression (i.e. diode or varistor) should be used on the coil of the load. If no suppression is used then over voltage spikes can cause damage to the digital inputs and outputs on the drive.

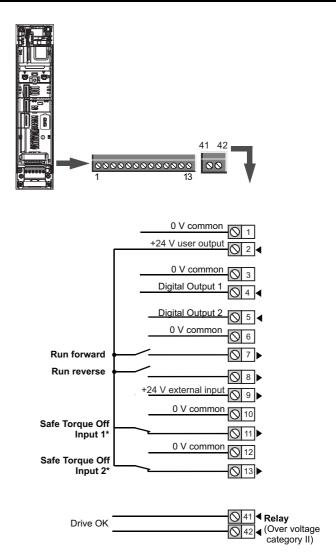

Ensure the logic sense is correct for the control circuit to be used. Incorrect logic sense could cause the motor to be started unexpectedly. Positive logic is the default state for the drive.

NOTE

Any signal cables which are carried inside the motor cable (i.e. motor thermistor, motor brake) will pick up large pulse currents via the cable capacitance. The shield of these signal cables must be connected to ground close to the point of exit of the motor cable, to avoid this noise current spreading through the control system.

To prevent the risk of a fire hazard in the event of a fault, a fuse or other over-current protection must be installed in the relay circuit.

4.4 Position feedback connections

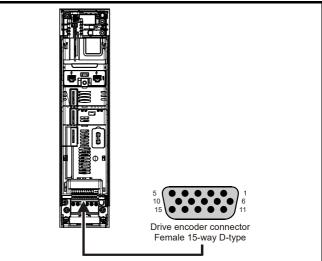

The following functions are provided via the 15-way high density D-type connector on the drive:

- Two position feedback interfaces (P1 and P2).
- One encoder simulation output.
- Two freeze trigger inputs (marker inputs).
- One thermistor input.

The P1 position interface is always available but the availability of the P2 position interface and the encoder simulation output depends on the position feedback device used on the P1 position interface, as shown in Table 4-9.

4.4.1 Location of position feedback connector

* This feedback device provides very low resolution feedback and should not be used for applications requiring a high level of performance

Table 4-8 Supported feedback devices on the P2 position interface

Encoder type	Pr 3.138 setting
Quadrature incremental encoders with or without marker pulse	AB (1)
Frequency and direction incremental encoders with or without marker pulse	FD (2)
Forward / reverse incremental encoders with or without marker pulse	FR (3)
EnDat communication only encoders	EnDat (4)
SSI encoders (Gray code or binary)	SSI (5)
BiSS communication only encoders	BiSS (6)

Table 4-9 shows the possible combinations of position feedback device types connected to the P1 and P2 position interfaces and the availability of the encoder simulation output.

Table 4-9 Availability of the P2 position feedback interface and the encoder simulation output

	Functions			
P1 Position feedback interface	P2 Position feedback interface	Encoder Simulation Output		
AB Servo FD Servo FR Servo SC Servo SC SC Commutation only	None	None		
AB FD FR SC	AB, FD, FR EnDat, BiSS, SSI	None		
SC Resolver SC Hiperface	None	Full		
SC EnDat SC SSI	AB, FD, FR (No Z marker pulse input) EnDat, BiSS, SSI (with freeze input)	None		
	None	No Z marker pulse output		
EnDat BiSS	AB, FD, FR EnDat, BiSS, SSI (with freeze input)	None		
SSI	None	Full		
	EnDat, BiSS, SSI	No Z marker pulse output		

The priority of the position feedback interfaces and the encoder simulation output on the 15-way D-type is assigned in the following order from the highest priority to the lowest.

- P1 position interface (highest)
- Encoder simulation output
- P2 position interface (lowest)

For example, if an AB Servo type position feedback device is selected for use on the P1 position interface, then both the encoder simulation output and the P2 position interface will not be available as this device uses all connections of the 15-way D-type connector. Also, if an AB type position feedback device is selected for use on the P1 position interface and Pr **03.085** is set to a valid source for the encoder simulation output, then the P2 position interface will not be available.

Depending on the device type used on the P1 position interface, the encoder simulation output may not be able support a marker pulse output (e.g. SC EnDat or SC SSI device types). Pr **03.086** shows the status of the encoder simulation output indicating whether the output is disabled, no marker pulse is available or full encoder simulation is available.

NOTE

When using the P1 and P2 position interfaces and the encoder simulation output together, the P2 position interface uses alternative connections on the 15-way D-type connector. Pr **03.172** shows the status of the P2 position interface and indicates if alternative connections are being used for the P2 position interface.

Supply	y voltage	5.15 V \pm 2 %, 8 V \pm 5 % or 15 V \pm 5 %			
Maximum output current		300 mA for 5 V and 8 V 200 mA for 15 V			
The voltage on Terminal 13 is controlled by Pr 03 036. The default for t					

The voltage on Terminal 13 is controlled by Pr **03.036**. The default for this parameter is 5 V (0) but this can be set to 8 V (1) or 15 V (2). Setting the encoder voltage too high for the encoder could result in damage to the feedback device. The termination resistors should be disabled if the outputs from the encoder are higher than 5 V.

14 0V Common

15 Motor thermistor input

Thermistor type is selected in P1 Thermistor Type (03.118).

Sincos encoder resolution

The sine wave frequency can be up to 500 kHz but the resolution is reduced at high frequency. Table 4-12 shows the number of bits of interpolated information at different frequencies and with different voltage levels at the drive encoder port. The total resolution in bits per revolution is the ELPR plus the number of bits of interpolated information. Although it is possible to obtain 11 bits of interpolation information, the nominal design value is 10 bits.

 Table 4-12
 Feedback resolution based on frequency and voltage level

Volt/Freq	1 kHz	5 kHz	50 kHz	100 kHz	200 kHz	500 kHz

0.6	10	10	9	9	8	7
0.4	9	9	9	8	7	6

4.5 Safe Torque Off (STO)

The *Unidrive M700 / M701* has a single channel STO, whereas the *Unidrive M702* has a dual channel STO.

The Safe Torque Off function provides a means for preventing the drive from generating torque in the motor, with a very high level of integrity. It is suitable for incorporation into a safety system for a machine. It is also suitable for use as a conventional drive enable input.

The safety function is active when the STO input is in the logic-low state as specified in the control terminal specification. The function is defined according to EN 61800-5-2 and IEC 61800-5-2 as follows. (In these standards a drive offering safety-related functions is referred to as a PDS(SR)):

'Power that can cause rotation (or motion in the case of a linear motor) is not applied to the motor. The PDS(SR) will not provide energy to the motor which can generate torque (or force in the case of a linear motor)'

This safety function corresponds to an uncontrolled stop in accordance with stop category 0 of IEC 60204-1.

The Safe Torque Off function makes use of the special property of an inverter drive with an induction motor, which is that torque cannot be generated without the continuous correct active behaviour of the inverter circuit. All credible faults in the inverter power circuit cause a loss of torque generation.

The Safe Torque Off function is fail-safe, so when the Safe Torque Off input is disconnected the drive will not operate the motor, even if a combination of components within the drive has failed. Most component failures are revealed by the drive failing to operate. Safe Torque Off is also independent of the drive firmware. This meets the requirements of the following standards, for the prevention of operation of the motor.

Machinery Applications

The Safe Torque Off function has been independently assessed by Notified Body, TüV Rheinland for use as a safety component of a machine:

Prevention of unintended motor operation: The safety function "Safe Torque Off" can be used in applications up to Cat 4, PL e according to EN ISO 13849-1, SIL 3 according to EN 61800-5-2/ EN 62061/ IEC 61508 and in lift applications according to EN 81-1 and EN81-2.

NOTE

Logic levels comply with IEC 61131-2:2007 for type 1 digital inputs rated at 24 V. Maximum level for logic low to achieve SIL3 and PL e 5 V and 0.5 mA.

Lift (Elevator) Applications

The Safe Torque Off function has been independently assessed for use as a safety component in lift (elevator) applications by Notified Body, TüV Nord:

The Unidrive M drives series with Safe Torque Off (STO) function if applied according to the "Conditions of application" fulfil the safety requirements of the standards EN81-1, EN81-2, EN 81-50 and EN60664-1and are in conformity with all relevant requirements of the Directive 95/16/EC.

Certificate of Conformity number	Date of issue	Models
44799 13196202	04-08-2015	M700, M701, M702

The Safe Torque Off function can be used to eliminate electromechanical contactors, including special safety contactors, which would otherwise be required for safety applications.

For further information contact the supplier of the drive.

UL Approval

The Safe Torque Off function has been independently assessed by Underwriters Laboratories (UL). The on-line certification (yellow card) reference is: FSPC.E171230.

Two-channel Safe Torque Off

Models M700 and M701 have a single channel STO, whereas the M702 has dual channel STO.

The dual channel STO has two fully independent channels.

Each input meets the requirements of the standards as defined above.

If either or both inputs are set at a logic low state, there are no single faults in the drive which can permit the motor to be driven.

It is not necessary to use both channels to meet the requirements of the standards. The purpose of the two channels is to allow connection to machine safety systems where two channels are required, and to facilitate protection against wiring faults.

For example, if each channel is connected to a safety-related digital output of a safety related controller, computer or PLC, then on detection of a fault in one output the drive can still be disabled safely through the other output.

Under these conditions, there are no single wiring faults which can cause a loss of the safety function, i.e. inadvertent enabling of the drive.

In the event that the two-channel operation is not required, the two inputs can be connected together to form a single Safe Torque Off input.

One-channel Safe Torque Off (Including Two- channel Safe Torque off with the inputs connected together.)

In a single channel Safe Torque Off application there are no single faults in the drive which can permit the motor to be driven. Therefore it is not necessary to have a second channel to interrupt the power connection, nor a fault detection circuit.

It is important to note that a single short-circuit from the Safe Torque Off input to a DC supply of > 5 V could cause the drive to be enabled.

This might occur through a fault in the wiring. This can be excluded according to EN ISO 13849-2 by the use of protected wiring. The wiring can be protected by either of the following methods:

• By placing the wiring in a segregated cable duct or other enclosure.

or

• By providing the wiring with a grounded (0V of the Drive) shield in a positive-logic grounded control circuit. The shield is provided to avoid a hazard from an electrical fault. It may be grounded by any convenient method; no special EMC precautions are required.

Note on response time of Safe Torque Off, and use with safety controllers with self-testing outputs:

Safe Torque Off has been designed to have a response time of greater than 1 ms so that it is compatible with safety controllers whose outputs are subject to a dynamic test with a pulse width not exceeding 1 ms.

Note on the use of servo motors, other permanent-magnet motors, reluctance motors and salient-pole induction motors:

When the drive is disabled through Safe Torque Off, a possible (although highly unlikely) failure mode is for two power devices in the inverter circuit to conduct incorrectly.

Safety information Product information Mechanical installation Electrical installation Getting started Basic parameters Running the motor Optimization NV Media Card Operation Onboard PLC Advanced parameters Diagnos	ostics UL information
--	--------------------------

This fault cannot produce a steady rotating torque in any AC motor. It produces no torque in a conventional induction motor with a cage rotor. If the rotor has permanent magnets and/or saliency, then a transient alignment torque may occur. The motor may briefly try to rotate by up to 180° electrical, for a permanent magnet motor, or 90° electrical, for a salient pole induction motor or reluctance motor. This possible failure mode must be allowed for in the machine design.

The design of safety-related control systems must only be done by personnel with the required training and experience. The Safe Torque Off function will only ensure the safety of a machine if it is correctly incorporated into a complete safety system. The system must be subject to a risk assessment to confirm that the residual risk of an unsafe event is at an acceptable level for the application.

Safe Torque Off inhibits the operation of the drive, this includes inhibiting braking. If the drive is required to provide both braking and Safe Torque Off in the same operation (e.g. for emergency stop) then a safety timer relay or similar device must be used to ensure that the drive is disabled a suitable time after braking. The braking function in the drive is provided by an electronic circuit which is not fail-safe. If braking is a safety requirement, it must be supplemented by an independent fail-safe braking mechanism.

Safe Torque Off does not provide electrical isolation. The supply to the drive must be disconnected by an approved isolation device before gaining access to power connections.

It is essential to observe the maximum permitted voltage of 5 V for a safe low (disabled) state of Safe Torque Off. The connections to the drive must be arranged so that voltage drops in the 0 V wiring cannot exceed this value under any loading condition. It is strongly recommended that the Safe Torque Off circuit be provided with a dedicated 0 V conductor which should be connected to terminal 30 at the drive.

Safe Torque Off over-ride

The drive does not provide any facility to over-ride the Safe Torque Off function, for example for maintenance purposes.

5 Getting started

This chapter introduces the user interfaces, menu structure and security levels of the drive.

5.1 Understanding the display

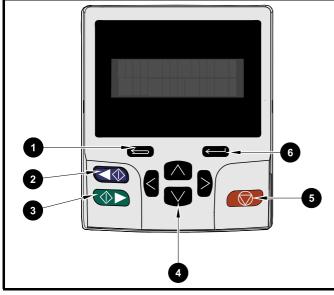

The keypad can only be mounted on the drive.

5.1.1 KI-Keypad

The KI-Keypad display consists of two rows of text. The upper row shows the drive status or the menu and parameter number currently being viewed. The lower row of the display line shows the parameter value or the specific trip type. The last two characters on the first row may display special indications. If more than one of these indications is active then the indications are prioritized as shown in Table 5-2.

When the drive is powered up the lower row will show the power up parameter defined by *Parameter Displayed At Power-Up* (11.022).

Figure 5-1 KI-Keypad

- 1. Escape button
- 2. Start reverse (Auxiliary button)
- 3. Start forward
- 4. Navigation keys (x4)
- Stop / Reset (red) button
 Enter button

6. Enter l

NOTE

The red stop *button* is also used to reset the drive.

The parameter value is correctly displayed in the lower row of the keypad display, see table below.

Table 5-1 Keypad display formats

Display formats	Value
IP Address	127.000.000.000
MAC Address	01ABCDEF2345
Time	12:34:56
Date	31-12-11 or 12-31-11
Version number	01.02.02.00
Character	ABCD
32 bit number with decimal point	21474836.47
16 bit binary number	0100001011100101

Table 5-2 Active action icon									
Active action icon	Description	Priority							
¥	Alarm active								
Ū.	Keypad real-time clock battery low								
D	Accessing non-volatile media card								
	Drive security active and locked or unlocked								
Π	Motor map 2 active								
44	User program running								
⊿	Keypad reference active								

5.2 Keypad operation

5.2.1 Control buttons

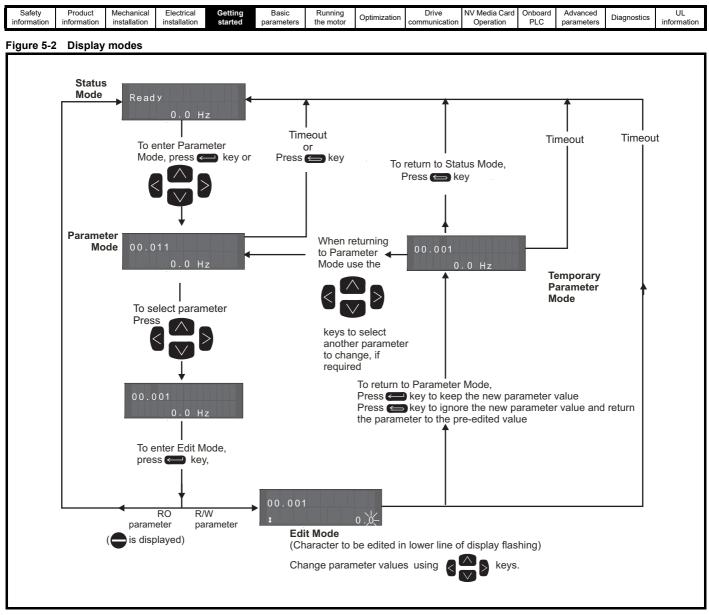

The keypad consists of:

- Navigation Keys Used to navigate the parameter structure and change parameter values.
- Enter / Mode button Used to toggle between parameter edit and view mode.
- Escape / Exit button Used to exit from parameter edit or view mode. In parameter edit mode, if parameter values are edited and the exit button pressed the parameter value will be restored to the value it had on entry to edit mode.
- Start forward button Use to provide a 'Run' command if keypad mode is selected.
- Start reverse button Used to control the drive if keypad mode is selected and the reverse button is activated. If *Enable Auxiliary Key* (06.013) = 1, then the keypad reference is toggled between run forward and run reverse each time the button is pressed. If *Enable Auxiliary Key* (06.013) = 2, then the button functions as a run reverse key.
- Stop / Reset button Used to reset the drive. In keypad mode can be used for 'Stop'.

NOTE

Low battery voltage is indicated by 📋 low battery symbol on the keypad display.

Figure 5-2 overleaf shows an example on moving between menus and editing parameters.

NOTE

The navigation keys can only be used to move between menus if Pr 00.049 has been set to show 'All Menus'. Refer to section 5.9 Parameter access level and security on page 46.

5.2.2 Quick access mode

The quick access mode allows direct access to any parameter without scrolling through menus and parameters.

To enter the quick access mode, press and hold the Enter button on the keypad while in 'parameter mode'.

Figure 5-3 Quick access mode

5.2.3 Keypad shortcuts

In 'parameter mode':

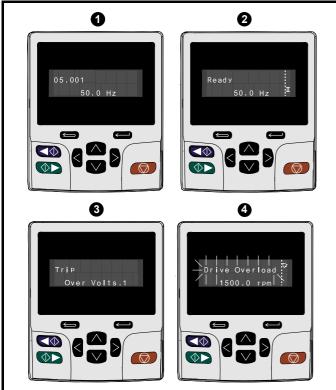

- If the up and down keypad buttons are pressed together, then the keypad display will jump to the start of the parameter menu being viewed, i.e. Pr **05.005** being viewed, when the above buttons pressed together will jump to Pr **05.000**.
- If the left and right keypad buttons are pressed together, then the keypad display will jump to the last viewed parameter in Menu 0.

In 'parameter edit mode':

- If the up and down keypad buttons are pressed together, then the parameter value of the parameter being edited will be set to 0.
- If the left and right keypad buttons are pressed together, the least significant digit (furthest right) will be selected on the keypad display for editing.

information	information	installation	installation	started	parameters	the motor	Optimization	communication	Operation	PLC	parameters	Diagnostics	information
					•								

Figure 5-4 Mode examples

1. Parameter view mode: Read write or Read only

2. Status mode: Drive OK status

If the drive is ok and the parameters are not being edited or viewed, the upper row of the display will show one of the following:

• 'Inhibit', 'Ready' or 'Run'.

3. Status mode: Trip status

When the drive is in trip condition, the upper row of the display will indicate that the drive has tripped and the lower row of the display will show the trip code. For further information regarding trip codes. refer to Table 13-4 *Trip indications* on page 247.

4. Status mode: Alarm status

During an 'alarm' condition the upper row of the display flashes between the drive status (Inhibit, Ready or Run, depending on what is displayed) and the alarm.

Do not change parameter values without careful consideration; incorrect values may cause damage or a safety hazard.

NOTE

When changing the values of parameters, make a note of the new values in case they need to be entered again.

NOTE

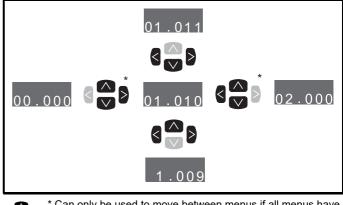

For new parameter-values to apply after the line power supply to the drive is interrupted, new values must be saved. Refer to section 5.7 *Saving parameters* on page 45.

5.3 Menu structure

The drive parameter structure consists of menus and parameters.

The drive initially powers up so that only Menu 0 can be viewed. The up and down arrow buttons are used to navigate between parameters and once Pr **00.049** has been set to 'All Menus' the left and right buttons are used to navigate between menus. For further information, refer to section 5.9 *Parameter access level and security* on page 46.

Figure 5-5 Parameter navigation

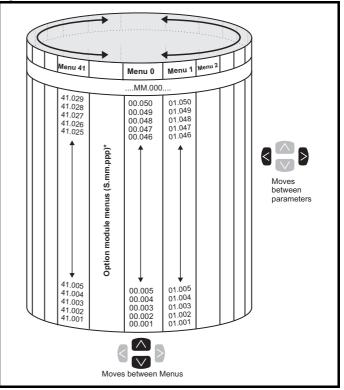

Can only be used to move between menus if all menus have been enabled (Pr 00.049). Refer to section 5.9 Parameter access level and security on page 46.

The menus and parameters roll over in both directions.

i.e. if the last parameter is displayed, a further press will cause the display to rollover and show the first parameter.

When changing between menus the drive remembers which parameter was last viewed in a particular menu and thus displays that parameter.

Figure 5-6 Menu structure

* The option module menus (S.mm.ppp) are only displayed if option modules are installed. Where S signifies the option module slot number and the mm.ppp signifies the menu and the parameter number of the option module's internal menus and parameter.

	Internation	internation	motanation	motanation	otartou	parametere			commanication	oporation	. 20	paramotoro		internation

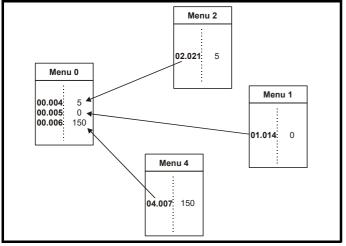

5.4 Menu 0

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. The parameters displayed in Menu 0 can be configured in Menu 22.

Appropriate parameters are copied from the advanced menus into Menu 0 and thus exist in both locations.

For further information, refer to Chapter 6 Basic parameters on page 49.

Figure 5-7 Menu 0 copying

5.5 Advanced menus

The advanced menus consist of groups or parameters appropriate to a specific function or feature of the drive. Menus 0 to 41 can be viewed on the KI-Keypad.

The option module menus (S.mm.ppp) are only displayed (except for *Unidrive M700 / M702* 4.mm.ppp) if option modules are installed. Where S signifies the option module slot number and the mm.ppp signifies the menu and parameter number of the option module's internal menus and parameter.

On Unidrive M700 / M702, menu 4.00.xxx is the same as menu 24.xxx.

 Table 5-3
 Advanced menu descriptions

5.5.1 KI-Keypad set-up menu

To enter the keypad set-up menu press and hold the escape button on the keypad from status mode. All the keypad parameters are saved to the keypad non-volatile memory when exiting from the keypad set-up menu.

To exit from the keypad set-up menu press the escape 😂 or 🕻 or

button. Below are the keypad set-up parameters.

Table 5-4 KI-Keypad set-up parameters

	Parameters	Range	Туре

Keypad. 08	Font version	0 to 1000	RO
Keypad. 09	Show menu names	Off or on	RW

* The languages available will depend on the keypad software version.

NOTE

It is not possible to access the keypad parameters via any communications channel.

5.5.2 Alarm indications

An alarm is an indication given on the display by alternating the alarm string with the drive status string on the upper row and showing the alarm symbol in the last character in the upper row. Alarms strings are not displayed when a parameter is being edited, but the user will still see the alarm character on the upper row.

Table 5-5 Alarm indications

Alarm string	Description
Brake Resistor	Brake resistor overload. <i>Braking Resistor Thermal Accumulator</i> (10.039) in the drive has reached 75.0 % of the value at which the drive will trip.
Motor Overload	Motor Protection Accumulator (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is > 100 %.
Ind Overload	Regen inductor overload. <i>Inductor Protection</i> <i>Accumulator</i> (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is > 100 %.
Drive Overload	Drive over temperature. <i>Percentage Of Drive</i> <i>Thermal Trip Level</i> (07.036) in the drive is greater than 90 %.
Auto Tune	The autotune procedure has been initialized and an autotune in progress.
Limit Switch	Limit switch active. Indicates that a limit switch is active and that is causing the motor to be stopped.

5.5.3 Display messages

The following tables indicate the various possible mnemonics which can be displayed by the drive and their meaning.

Table 5-6 Status indications

Upper row string	Description	Drive output stage
Inhibit	The drive is inhibited and cannot be run. The Safe Torque Off signal is not applied to Safe Torque Off terminals or Pr 06.015 is set to 0. The other conditions that can prevent the drive from enabling are shown as bits in <i>Enable Conditions</i> (06.010)	Disabled
Ready	The drive is ready to run. The drive enable is active, but the drive inverter is not active because the final drive run is not active	Disabled
Stop	The drive is stopped / holding zero speed.	Enabled
Run	The drive is active and running	Enabled
Scan	The drive is enabled in Regen mode and is trying to synchronize to the supply	Enabled
Supply Loss	Supply loss condition has been detected	Enabled
Deceleration	The motor is being decelerated to zero speed / frequency because the final drive run has been deactivated.	Enabled
dc injection	The drive is applying dc injection braking	Enabled
Position	Positioning / position control is active during an orientation stop	Enabled
Trip	The drive has tripped and no longer controlling the motor. The trip code appears in the lower display.	Disabled
Active	The Regen unit is enabled and synchronized to the supply	Enabled
Under Voltage	The drive is in the under voltage state either in low voltage or high voltage mode.	Disabled
Heat	The motor pre-heat function is active	Enabled
Phasing	The drive is performing a 'phasing test on enable'	Enabled

information installation installation started parameters the motor communication Operation PLC parameters infor	Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	Drive	NV Media Card	Onboard	Advanced	Diagnostics	UL

Table 5-7 Option module and NV media card and other status indications at power-up

First row string	Second row string	Status							
Booting	Parameters	Parameters are being loaded							
Drive parameters are being loaded from a NV Media Card									
Booting	User Program	User program being loaded							
User program is being loaded from a NV Media Card to the drive									
Booting	Option Program	User program being loaded							
User program is being loaded from a NV Media Card to the option module in slot X									
Writing To	NV Card	Data being written to NV Media Card							
Data is being written to a NV Media Card to ensure that its copy of the drive parameters is correct because the drive is in Auto or Boot mode									
Waiting For	Power System	Waiting for power stage							
The drive is after power-	U 1	sor in the power stage to respond							
Waiting For	Options	Waiting for an option module							
The drive is waiting for the options modules to respond after power-up									
Uploading From	Options	Loading parameter database							
held by the o	drive because an optio	to update the parameter database on module has changed or because							

held by the drive because an option module has changed or because an applications module has requested changes to the parameter structure. This may involve data transfer between the drive an option modules. During this period 'Uploading From Options' is displayed

5.6 Changing the operating mode

Changing the operating mode returns all parameters to their default value, including the motor parameters. *User security status* (00.049) and *User security code* (00.034) are not affected by this procedure).

Procedure

Use the following procedure only if a different operating mode is required:

- Ensure the drive is not enabled, i.e. terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702 is open or Pr 06.015 is Off (0)
- Enter either of the following values in Pr mm.000, as appropriate: 1253 (50 Hz AC supply frequency) 1254 (60 Hz AC supply frequency)

3. Change the setting of Pr 00.048 as follows:

Pr 00.048 setting		Operating mode
00.048 t Open-loop	1	Open-loop
00.048 \$ RFC-A	2	RFC-A
00.048 t RFC-S	3	RFC-S
00.048 t Regen	4	Regen

The figures in the second column apply when the communications interface is used.

- 4. Either:
- Press the red preset button
- Toggle the reset digital input
- Carry out a drive reset through the communications interface by setting Pr **10.038** to 100.

NOTE

Entering 1253 or 1254 in Pr **mm.000** will only load defaults if the setting of Pr **00.048** has been changed.

5.7 Saving parameters

When changing a parameter in Menu 0, the new value is saved when

pressing the Enter button to return to parameter view mode from parameter edit mode.

If parameters have been changed in the advanced menus, then the change will not be saved automatically. A save function must be carried out.

Procedure

- 1. Select 'Save Parameters' in Pr **mm.000** (alternatively enter a value of 1001 in Pr **mm.000**)
- 2. Either:
- Press the red
 reset button
- Toggle the reset digital input, or
- Carry out a drive reset through the communications interface by setting Pr 10.038 to 100

5.8 Restoring parameter defaults

Restoring parameter defaults by this method saves the default values in the drives memory. *User security status* (00.049) and *User security code* (00.034) are not affected by this procedure).

Procedure

- Ensure the drive is not enabled, i.e. terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702 is open or Pr 06.015 is Off (0)
- Select 'Reset 50 Hz Defs' or 'Reset 60 Hz Defs' in Pr mm.000. (alternatively, enter 1233 (50 Hz settings) or 1244 (60 Hz settings) in Pr mm.000).
- 3. Either:
- Press the red
 reset button
- Toggle the reset digital input
- Carry out a drive reset through the communications interface by setting Pr 10.038 to 100

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	Drive	NV Media Card	Onboard	Advanced	Disgnastics	UL
information	information	installation	installation	started	parameters	the motor	Optimization	communication	Operation	PLC	parameters	Diagnostics	information

5.9 Parameter access level and security

The parameter access level determines whether the user has access to Menu 0 only or to all the advanced menus (Menus 1 to 41) in addition to Menu 0.

The User Security determines whether the access to the user is read only or read write.

Both the User Security and Parameter Access Level can operate independently of each other as shown in Table 5-8.

Table 5-8	Parameter access level and security	
-----------	-------------------------------------	--

User security status (11.044)	Access level	User security	Menu 0 status	Advanced menu status
0	Menu 0	Open	RW	Not visible
0		Closed	RO	Not visible
1	All Menus	Open	RW	RW
I	All Merius	Closed	RO	RO
2	Read-only	Open	RO	Not visible
2	Menu 0	Closed	RO	Not visible
3	Read-only	Open	RO	RO
5	Read-only	Closed	RO	RO
4	Status only	Open	Not visible	Not visible
4	Status Offy	Closed	Not visible	Not visible
5	No access	Open	Not visible	Not visible
5	NU ACCESS	Closed	Not visible	Not visible

The default settings of the drive are Parameter Access Level Menu 0 and user Security Open i.e. read / write access to Menu 0 with the advanced menus not visible.

5.9.1 User Security Level / Access Level

The drive provides a number of different levels of security that can be set by the user via *User Security Status* (11.044); these are shown below.

User Security Status (Pr 11.044)	Description
Menu 0 (0)	All writable parameters are available to be edited but only parameters in Menu 0 are visible
All menus (1)	All parameters are visible and all writable parameters are available to be edited
Read- only Menu 0 (2)	Access is limited to Menu 0 parameters only. All parameters are read-only
Read-only (3)	All parameters are read-only however all menus and parameters are visible
Status only (4)	The keypad remains in status mode and no parameters can be viewed or edited
No access (5)	The keypad remains in status mode and no parameters can be viewed or edited. Drive parameters cannot be accessed via a comms/ fieldbus interface in the drive or any option module

5.9.2 Changing the User Security Level /Access Level

The security level is determined by the setting of Pr **00.049** or Pr **11.044**. The Security Level can be changed through the keypad even if the User Security Code has been set.

5.9.3 User Security Code

The User Security Code, when set, prevents write access to any of the parameters in any menu.

Setting User Security Code

Enter a value between 1 and 2147483647 in Pr 00.034 and press the

button; the security code has now been set to this value. In order

to activate the security, the Security level must be set to desired level in $\Pr{00.049}$. When the drive is reset, the security code will have been

activated and the drive returns to Menu 0 and the 🔂 symbol is displayed in the right hand corner of the keypad display. The value of Pr **00.034** will return to 0 in order to hide the security code.

Unlocking User Security Code

Select a parameter that need to be edited and press the certain button, the upper display will now show 'Security Code'. Use the arrow buttons

to set the security code and press the button. With the correct security code entered, the display will revert to the parameter selected in edit mode.

If an incorrect security code is entered, the following message 'Incorrect security code' is displayed, then the display will revert to parameter view mode.

Disabling User Security

Unlock the previously set security code as detailed above. Set Pr 00.034

to 0 and press the button. The User Security has now been disabled, and will not have to be unlocked each time the drive is powered up to allow read / write access to the parameters.

5.10 Displaying parameters with non-default values only

By selecting 'Show non-default' in Pr **mm.000** (Alternatively, enter 12000 in Pr **mm.000**), the only parameters that will be visible to the user will be those containing a non-default value. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr **mm.000** and select 'No action' (alternatively enter a value of 0). Please note that this function can be affected by the access level enabled, refer to section 5.9 *Parameter access level and security* on page 46 for further information regarding access level.

5.11 Displaying destination parameters only

By selecting 'Destinations' in Pr **mm.000** (Alternatively enter 12001 in Pr **mm.000**), the only parameters that will be visible to the user will be destination parameters. This function does not require a drive reset to become active. In order to deactivate this function, return to Pr **mm.000** and select 'No action' (alternatively enter a value of 0).

Please note that this function can be affected by the access level enabled, refer to section 5.9 *Parameter access level and security* on page 46 for further information regarding access level.

5.12 Communications

The *Unidrive M700 / M702* drives offer Ethernet fieldbus communications and the *Unidrive M701* drive offers a 2 wire EIA 485 interface. This enables the drive set-up, operation and monitoring to be carried out with a PC or controller if required.

										_			
Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	Drive	NV Media Card	Onboard	Advanced	Diagnostica	UL
information	information	installation	installation	started	parameters	the motor	Optimization	communication	Operation	PLC	parameters	Diagnostics	information

5.12.1 Unidrive M700 / M702 - Ethernet communications

The drive offers fieldbus communications via Ethernet, this enables the drive set-up, operation and monitoring to be carried out with a PC or controller. The drive provides two RJ45 connections with an Ethernet switch for easy network creation. The Ethernet option provides support for the following protocols:

- Modbus TCP
- EtherNet/IP or Profinet IO
- Web pages*
- Email**
- Synchronization with IEEE1588
- RTMoE

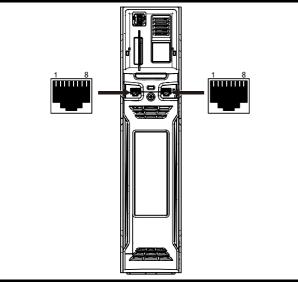

*Basic Web page functionality only

**Features have not been implemented but will be available soon.

In addition to two RJ45 connectors, each port provides a status LED for diagnostic / information purposes.

LED status	Description
Off	Ethernet connection not detected
Solid green	Ethernet connection detected but no data
Flashing green	Ethernet connection detected and data flow

Figure 5-8 Location of the Ethernet ports

NOTE

The shell of the RJ45 connector is isolated from the 0V of the drive control terminals but it is connected to ground.

NOTE

Modbus TCP/IP has a maximum number of 4 client connections. Refer to Pr **4.15.006** (Maximum Connections) in the *Parameter Reference Guide*. The default value of Pr **4.15.006** is 2 client connections, but the maximum number of client connections is 10.

Recommended cable

It is recommended that a minimum specification of CAT5e is used in new installations. If the existing cabling is used this may limit the maximum data rate depending on the cable ratings. In noisy environments the use of STP cable will offer additional noise immunity.

Maximum network lengths

The main restriction imposed on the Ethernet cabling is the length of a single segment of the cable, for Copper - UTP/STP CAT 5 cable type, maximum trunk cable length should be limited to 100 m. If distances greater than this are required it may be possible to extend the network with additional switches.

Ethernet set-up parameters

This section covers the parameters necessary to establish an Ethernet connection to the drive.

Table 5-9 Key to parameter table coding

	, ,	•	
RW	Read / Write	ND	No default value
RO	Read only	NC	Not copied
Num	Number parameter	PT	Protected parameter
Bit	Bit parameter	RA	Rating dependant
Txt	Text string	US	User save
Bin	Binary parameter	PS	Power-down save
FI	Filtered	DE	Destination
IP	IP Address	Mac	Mac Address
Date	Date parameter	Time	Time parameter
Chr	Character parameter		

		007 007}	Reset						
R\	N	Bit						US	
ţ		Off	f (0) or	On (1)	⇒	Off (0)			

Changes to the Ethernet set-up parameters will not take effect until a *Reset* (4.00.007) has been performed.

	.00. 24.0		Active	IP Ad	dress				
R	0	IP						US	
Û			000.00 7.255.2			⇒			

This parameter displays the Active IP Address. The Active IP Address can also be viewed in Pr **00.037**.

4	4.02.005 DHCP Enable									
R١	Ν	Bit							US	
Û		Of	f (0) or	On (1)		⇒		 On (1)	

If *DHCP Enable* (4.02.005) is set to On (1), the IP address is acquired from the DHCP server and written to *IP Address* (4.02.006).

NOTE

When using manual / static IP address configuration, ensure *Subnet Mask* (4.02.007) and *Default Gateway* (4.02.008) should also be set manually.

NOTE

If *Protocol Mode Select* (4.02.018) is set to Profinet (2) and the IP address is assigned to a Profinet Controller, *DHCP Enable* (4.02.005) will be ignored and set to Off (0) on initialisation.

4.02.006 IP Address										
R۱	Ν	IP							US	
ţ			000.00 5.255.2		-	⇔	192	2.168.0	01.100	

This parameter controls and displays the IP address of the drive. If *DHCP Enable* (4.02.005) is set to On (1) this parameter will become read-only.

Safety information Product information Mechanical installation Electrical installation Getting started Basic parameters Running the motor Drive communication NV Media Card Onboard Advanced parameters	Diagnostics UL information	
--	----------------------------	--

4	.02.	007	Subne	et Mask	(
R١	Ν	IP							US	
$\hat{\mathbf{v}}$			000.00 5.255.2		-	⇒	25	5.255.2	55.000	

This parameter controls and displays the *Subnet Mask* (4.02.007) of the drive.

4.0	2.008	Defau	lt Gate	way					
RW	IP							US	
Û		000.00 5.255.2			₽	19	92.168.	1.254	

This parameter controls and displays the *Default Gateway* (4.02.008) of the drive.

PC Tools support

The discovery protocol feature, which is supported by the Unidrive M PC tools, is able to discover the drives that are connected to a PC, independent of above parameter settings.

5.12.2 Unidrive M701 - EIA 485 Serial communications

The EIA 485 option provides two parallel RJ45 connectors allowing easy daisy chaining. The drive only supports Modbus RTU protocol.

The serial communications port of the drive is a RJ45 socket, which is isolated from the power stage and the other control terminals (see section 4.2 *Communication connections* on page 23 for connection and isolation details).

The communications port applies a 2 unit load to the communications network.

USB/EIA 232 to EIA 485 Communications

An external USB/EIA 232 hardware interface such as a PC cannot be used directly with the 2-wire EIA 485 interface of the drive. Therefore a suitable converter is required.

Suitable USB to EIA 485 and EIA 232 to EIA 485 isolated converters are available from Control Techniques as follows:

- CT USB Comms cable (CT Part No. 4500-0096)
- CT EIA 232 Comms cable (CT Part No. 4500-0087)

NOTE

When using the CT EIA 232 Comms cable the available baud rate is limited to 19.2 k baud.

When using one of the above converters or any other suitable converter with the drive, it is recommended that no terminating resistors be connected on the network. It may be necessary to 'link out' the terminating resistor within the converter depending on which type is used. The information on how to link out the terminating resistor will normally be contained in the user information supplied with the converter.

Serial communications set-up parameters

The following parameters need to be set according to the system requirements.

Seria	I communications	set-up parameters
Serial Mode (11.024) {00.035}	8 2 NP (0), 8 1 NP (1), 8 1 EP (2), 8 1 OP (3), 8 2 NP M (4), 8 1 NP M (5), 8 1 EP M (6), 8 1 OP M (7), 7 2 NP (8), 7 1 NP (9), 7 1 EP (10), 7 1 OP (11), 7 2 NP M (12), 7 1 NP M (13), 7 1 OP M (15)	The drive only supports the Modbus RTU protocol and is always a slave. This parameter defines the supported data formats used by the EIA 485 comms port (if installed) on the drive. This parameter can be changed via the drive keypad, via a option module or via the comms interface itself.
Serial Baud Rate (11.025) {00.036}	300 (0), 600 (1), 1200 (2), 2400 (3), 4800 (4), 9600 (5), 19200 (6), 38400 (7), 57600(8), 76800(9), 115200 (10)	This parameter can be changed via the drive keypad, via a option module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original baud rate. The master should wait at least 20 ms before sending a new message using the new baud rate.
Serial Address (11.023) {00.037}	1 to 247	This parameter defines the serial address and an addresses between 1 and 247 are permitted.

6 Basic parameters

Menu 0 is used to bring together various commonly used parameters for basic easy set up of the drive. All the parameters in Menu 0 appear in other menus in the drive (denoted by $\{...\}$). Menu 22 can be used to configure the parameters in Menu 0.

6.1 Parameter ranges and variable minimum / maximums

Some parameters in the drive have a variable range with a variable minimum and a variable maximum value which is dependent on one of the following:

- The settings of other parameters
- The drive rating
- The drive mode
- Combination of any of the above

For more information, refer to section 12.1 Parameter ranges and Variable minimum/maximums on page 148

* Only applicable to Unidrive M701.

*** Only applicable to *Unidrive M702*.

***** Following a rotating autotune Pr **00.043** {05.010} is continuously written by the drive, calculated from the value of Stator Inductance (Pr **05.025**). To manually enter a value into Pr **00.043** {05.010}, Pr **05.025** will need to be set to 0. Please refer to the description of Pr **05.010** in the *Parameter Reference Guide* for further details.

** Only applicable to Unidrive M700 / M702.

**** Only applicable to Unidrive M700 / M701.

6.3 Parameter descriptions

6.3.1 Pr mm.000

Pr **mm.000** is available in all menus, commonly used functions are provided as text strings in Pr **mm.000** shown in Table 6-1. The functions in Table 6-1 can also be selected by entering the appropriate numeric values (as shown in Table 6-2) in Pr **mm.000**. For example, enter 4001 in Pr **mm.000** to store drive parameters on an NV Media Card.

Table	6-1	Commonly	used	functions	in xx.0	00
-------	-----	----------	------	-----------	---------	----

Value	Equivalent value	String	Action
0	0	[No Action]	
1001	1	[Save parameters]	Save parameters under all conditions
6001	2	[Load file 1]	Load the drive parameters or user program file from NV Media Card file 001
4001	3	[Save to file 1]	Transfer the drive parameters to parameter file 001
6002	4	[Load file 2]	Load the drive parameters or user program file from NV Media Card file 002
4002	5	[Save to file 2]	Transfer the drive parameters to parameter file 002
6003	6	[Load file 3]	Load the drive parameters or user program file from NV Media Card file 003
4003	7	[Save to file 3]	Transfer the drive parameters to parameter file 003
12000	8	[Show non-default]	Displays parameters that are different from defaults
12001	9	[Destinations]	Displays parameters that are set
1233	10	[Reset 50Hz defs]	Load parameters with standard (50 Hz) defaults
1244	11	[Reset 60Hz defs]	Load parameters with US (60 Hz) defaults
1070	12	[Reset modules]	Reset all option modules
11001	13	[Read enc. NP P1]	Transfer electronic nameplate motor parameters to the drive from the P1 encoder
11051	14	[Read enc. NP P2]	Transfer electronic nameplate motor parameters to the drive from the P2 encoder

6.4 Full descriptions

Table 6-3 Key to parameter table coding

Coding	Attribute
RW	Read/Write: can be written by the user
RO	Read only: can only be read by the user
Bit	1 bit parameter. 'On' or 'Off' on the display
Num	Number: can be uni-polar or bi-polar
Txt	Text: the parameter uses text strings instead of numbers.
Bin	Binary parameter
IP	IP Address parameter
Мас	Mac Address parameter
Date	Date parameter
Time	Time parameter
Chr	Character parameter
FI	Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing.
DE	Destination: This parameter selects the destination of an input or logic function.
RA	Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will be transferred to the destination drive by non-volatile storage media when the rating of the destination drive is different from the source drive and the file is a parameter file. However, the values will be transferred if only the current rating is different and the file is a difference from default type file.
ND	No default: The parameter is not modified when defaults are loaded
NC	Not copied: not transferred to or from non-volatile media during copying.
PT	Protected: cannot be used as a destination.
US	User save: parameter saved in drive EEPROM when the user initiates a parameter save.
PS	Power-down save: parameter automatically saved in drive EEPROM when the under volts (UV) state occurs.

6.4.1 Parameter x.00

	00.0 nm.	000 000}	Param	Parameter zero

Û	0 to 65,535					Û						

6.4.2 Speed limits

00.001	{01	.007}	Minim	um Re	e C	lam	р				
RW	RW Num							US			
OL									0.0 H	lz	
RFC-A	\hat{v}		NEGA AMP1	_	_	⊳	0.0 rpm				
RFC-S								0.01p			

(When the drive is jogging, [00.001] has no effect.)

Open-loop

Set Pr **00.001** at the required minimum output frequency of the drive for both directions of rotation. The drive speed reference is scaled between Pr **00.001** and Pr **00.002**. [**00.001**] is a nominal value; slip compensation may cause the actual frequency to be higher.

RFC-A / RFC-S

Set Pr **00.001** at the required minimum motor speed for both directions of rotation. The drive speed reference is scaled between Pr **00.001** and Pr **00.002**.

00.002	{01	.006}	Maximum Reference Clamp									
RW		Num							US			
OL									default default			
RFC-A	ţ	VM_POSITIVE_REF_ CLAMP1 Hz / rpm				⊳	50Hz default:1500.0 rpm 60Hz default:1800.0 rpm					
RFC-S								3	0.000	rpm		

(The drive has additional over-speed protection).

Open-loop

Set Pr **00.002** at the required maximum output frequency for both directions of rotation. The drive speed reference is scaled between Pr **00.001** and Pr **00.002**. [**00.002**] is a nominal value; slip compensation may cause the actual frequency to be higher.

RFC-A / RFC-S

Set Pr 00.002 at the required maximum motor speed for both directions of rotation. The drive speed reference is scaled between Pr 00.001 and Pr 00.002.

For operating at high speeds see section 8.6 *High speed operation* on page 109.

6.4.3 Ramps, speed reference selection, current limit

00.003 {02.011} Acceleration Rate 1											
RW		Num								US	
OL		0.0 to VM_ACCEL_RATE s/100 Hz						5.	0 s/10	0 Hz

Keypad Ref (6)	6	Keypad Reference

* Available on Unidrive M700 / M701 only.

00.006	{04	.007}	Symm	etrica	l Curre	nt l	imi	t			
RW		Num								US	
OL							165.0 %				
RFC-A	\hat{v}		to VM_ RRENT		_	⇔	175.0 %				
RFC-S				_					175.0	70	

Pr **00.006** limits the maximum output current of the drive (and hence maximum motor torque) to protect the drive and motor from overload.

Set Pr **00.006** at the required maximum torque as a percentage of the rated torque of the motor, as follows:

$$[00.006] = \frac{T_R}{T_{RATED}} \times 100$$
 (%)

Where:

T_R Required maximum torque

TRATED Motor rated torque

Alternatively, set Pr **00.006** at the required maximum active (torqueproducing) current as a percentage of the rated active current of the motor, as follows:

$$[00.006] = \frac{I_R}{I_{RATED}} \times 100 \,(\%)$$

Where:

IR Required maximum active current

IRATED Motor rated active current

6.4.4 Voltage boost, (open-loop), Speed-loop PID gains (RFC-A / RFC-S)

00.007 {	05.	014}	Open-loop Control Mode (OL)										
00.007 {	03.	010}	Spee	d Con	troller	Pro	opc	ortiona	I Gain	Кр1 (RFC)		
RW		Txt / Num								US			
OL	€	Fixed	(0), Ur (1), i (2), Ur Auto (3), ⇔ 4), Square (5)						Ur I (4)				
RFC-A	介	0 000	00 to 200.000 s/rad			仓	0.0300 s/rad						
RFC-S	\$	0.000	00 to 200.000 s/rad				0.0100 s/rad						

Open-loop

There are six voltage modes available, which fall into two categories, vector control and fixed boost. For further details, refer to *Pr 00.007* {05.014} Open Loop Control Mode on page 96.

RFC-A/ RFC-S

Pr **00.007** (**03.010**) operates in the feed-forward path of the speedcontrol loop in the drive. See Figure 12-4 on page 166 for a schematic of the speed controller. For information on setting up the speed controller gains, refer to Chapter 8 *Optimization* on page 95.

00.008 {	05.	015}	Low	Frequ	ency V	Low Frequency Voltage Boost (OL)									
00.008 {	03.	011}	Spee	d Con	troller	Int	egral Ga	in Ki1 ((RFC)						
RW		Num						US							
OL	$\hat{\mathbb{V}}$		0.0 to :	25.0 %	þ	合	3.0 %								
RFC-A	î	0.00	0.00 to 655.35 s ² /rad			合	0.10 s ² /rad								
RFC-S	\checkmark	0.00	0 to 655.35 s-/rad					1.00 s ²	/rad						

Open-loop

When *Open-loop Control Mode* (00.007) is set at **Fd** or **SrE**, set Pr **00.008** (**05.015**) at the required value for the motor to run reliably at low speeds.

Excessive values of Pr 00.008 can cause the motor to be overheated.

RFC-A/ RFC-S

Pr **00.008** (**03.011**) operates in the feed-forward path of the speedcontrol loop in the drive. See Figure 12-4 on page 166 for a schematic of the speed controller. For information on setting up the speed controller gains, refer to Chapter 8 *Optimization* on page 95.

00.009 {	05.0	013}	Dyna	mic \	/ to F 🗄	Sele	ct ((OL)				
00.009 {	03.0	012}	Speed Controller Differential Feedback Gain Kd 1 (RFC)								ain	
RW		Bit						US				
OL	\hat{v}	0	ff (0) c	(1)	⊳		Off (0)					
RFC-A RFC-S	ţ	(0.00000 to 0.65535 1/rad			Ŷ	0.00000 1/rad					

Open-loop

Set Pr **00.009** (**05.013**) at 0 when the V/f characteristic applied to the motor is to be fixed. It is then based on the rated voltage and frequency of the motor.

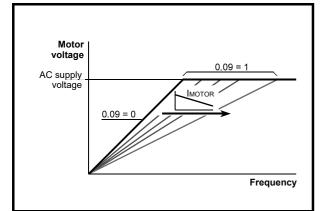

Set Pr **00.009** at 1 when reduced power dissipation is required in the motor when it is lightly loaded. The V/f characteristic is then variable resulting in the motor voltage being proportionally reduced for lower motor currents. Figure 6-3 shows the change in V/f slope when the motor current is reduced.

RFC-A / RFC-S

Pr **00.009** (**03.012**) operates in the feedback path of the speed-control loop in the drive. See Figure 12-4 *Menu 3 RFC-A, RFC-S logic diagram* on page 166 for a schematic of the speed controller. For information on setting up the speed controller gains, refer to Chapter 8 *Optimization* on page 95.

6.4.5 Monitoring

00.01	0 {0	5.004}	Motor	Rpm	-	-				
R)	Bit							US	
OL	€		±180000 rpm							

Open-loop

Pr 00.010 (05.004) indicates the value of motor speed that is estimated from the following:

02.001 Post Ramp Reference 00.042 Number Of Motor Poles

00.010 {03.002} Speed Feedback RO Num ND FI NC PT RFC-A ⇔

VM_SPEED rpm

RFC-A / RFC-S

RFC-S

Û

Pr 00.010 (03.002) indicates the value of motor speed that is obtained from the speed feedback.

00.011 {	05.(001}	Output Frequency (OL)									
00.011 {	03.(029}	P1 Pc	ositior	ו (RFC)						
RO		Num	FI		N	D	NC	PT				
OL	î	VM_	SPEED_FREQ_ RFF Hz			Û						
RFC-A	\mathbf{v}		REF	= Hz								
RFC-S	ΰ		0 to 65535									

Open-loop and RFC-A

Pr 00.011 displays the frequency at the drive output.

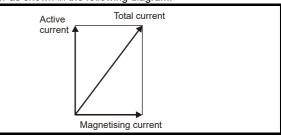

RFC-S

Pr 00.011 displays the position of the encoder in mechanical values of 0 to 65,535. There are 65,536 units to one mechanical revolution.

00.012	{04	.001}	Curre	nt Mag	Initude					
RO		Bit	FI			N	ID	NC	PT	
OL			0.00)0 to						
RFC-A	\hat{v}	VM_D		-	_	⇒				
RFC-S			UNIPC	ILAR A						

Pr 00.012 displays the rms value of the output current of the drive in each of the three phases. The phase currents consist of an active

component and a reactive component, which can form a resultant current vector as shown in the following diagram.

The active current is the torgue producing current and the reactive current is the magnetizing or flux-producing current.

00.013 {04.002} Torque Producing Current											
RO		Bit	FI			N	D	NC	PT		
OL											
RFC-A	\hat{v}	VM_D	RIVE_	CURRE	ENT A	⇔					
RFC-S											

When the motor is being driven below its rated speed, the torque is proportional to [00.013].

Jog reference, Ramp mode selector, Stop and 6.4.6 torque mode selectors

Pr 00.014 is used to select the required control mode of the drive as follows:

US

Setting	Open-Loop	RFC-A/S
0	Frequency control	Speed control
1	Torque control	Torque control
2		Torque control with speed override
3		Coiler/uncoiler mode
4		Speed control with torque feed- forward
5		Bi-directional torque control with speed override

00.015	{02	.004}	Ramp	Ramp Mode Select							
RW		Txt								US	
OL	\hat{v}	Fast	: (0), St Std bo		. ,	₽		St	andar	d (1)	
RFC-A RFC-S	€	Fas	t (0), S	tandaro	d (1)	Ŷ		St	andar	d (1)	

Pr 00.015 sets the ramp mode of the drive as shown below:

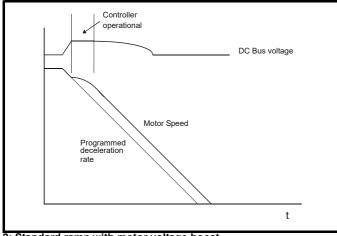

0: Fast ramp

Fast ramp is used where the deceleration follows the programmed deceleration rate subject to current limits. This mode must be used if a braking resistor is connected to the drive.

	1	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
--	---	-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	----------------------	--------------	---------------------	----------------------------	----------------	------------------------	-------------	-------------------

1: Standard ramp

Standard ramp is used. During deceleration, if the voltage rises to the standard ramp level (Pr **02.008**) it causes a controller to operate, the output of which changes the demanded load current in the motor. As the controller regulates the link voltage, the motor deceleration increases as the speed approaches zero speed. When the motor deceleration rate reaches the programmed deceleration rate the controller ceases to operate and the drive continues to decelerate at the programmed rate. If the standard ramp voltage (Pr **02.008**) is set lower than the nominal DC bus level the drive will not decelerate the motor, but it will coast to rest. The output of the ramp controller (when active) is a current demand that is fed to the frequency changing current controller (Open-loop modes) or the torque producing current controller (RFC-A or RFC-S modes). The gain of these controllers can be modified with Pr **00.038** and Pr **00.039**.

2: Standard ramp with motor voltage boost

This mode is the same as normal standard ramp mode except that the motor voltage is boosted by 20 %. This increases the losses in the motor, dissipating some of the mechanical energy as heat giving faster deceleration.

00.016	{02	2.002}	Ramp	Enab	le					
RW		Bit							US	
OL	\hat{v}					₽				
RFC-A RFC-S	€	C	Off (0) or On (1)					On (1)	

Setting Pr **00.016** to 0 allows the user to disable the ramps. This is generally used when the drive is required to closely follow a speed reference which already contains acceleration and deceleration ramps.

	00.017 {08.026} Digital Input 6 Dest						tion	*					
R١	Ν	Num		DE					PT	US			
OL	\hat{v}	0	00.000 to 59.999			₽		06.031					

* Not applicable to Unidrive M702.

Open-loop

Pr 00.017 sets the destination of digital input T29.

00.017	{04	.012}	Current Reference Filter Time Constant								
RW		Num								US	
RFC-A	$\hat{\mathbf{v}}$		0 0 to 2	05 0 mc		Ъ			0.0 m		
RFC-S	Ŷ		0.0 to 25.0 ms					0.0 ms			

RFC-A / RFC-S

A first order filter, with a time constant defined by Pr **00.017**, is provided on the current demand to reduce acoustic noise and vibration produced as a result of position feedback quantisation noise. The filter introduces a lag in the speed loop, and so the speed loop gains may need to be reduced to maintain stability as the filter time constant is increased.

00.018	00.018 {03.123} P1 Thermistor Fau								_		
RW		Txt									
OL			Non	e (0)							
RFC-A	\hat{v}		None (0) Temperature (1) emperature and short (2)					Ten	nperat	ure (1)	
RFC-S		Tempe	erature	and sr	nort (2)						

Defines the fault detection for the P1 thermistor input:

P1 Thermistor Fault Detection (03.123)	Fault detection
0: None	No detection active
1: Temperature	Over temperature detection
2: Temp and short	Over temperature and short circuit detection

If over temperature detection is enabled a *Thermistor*.001 trip is initiated if *P1 Thermistor Feedback* (03.119) is above the level defined by *P1 Thermistor Trip Threshold* (03.120). The trip cannot be reset until *P1 Thermistor Feedback* (03.119) is below *P1 Thermistor Reset Threshold* (03.121).

If short circuit detection is enabled then a *Th Short Circuit*.001 is initiated if *P1 Thermistor Feedback* (03.119) is below 50 Ohms.

Open-loop

When the drive is enabled with Pr **00.033** = 0, the output frequency starts at zero and ramps to the required reference. When the drive is enabled when Pr **00.033** has a non-zero value, the drive performs a start-up test to determine the motor speed and then sets the initial output frequency to the synchronous frequency of the motor. Restrictions may be placed on the frequencies detected by the drive as follows:

Pr 00.033	Pr string	Function
0	Disable	Disabled
1	Enable	Detect all frequencies
2	Fwd only	Detect positive frequencies only
3	Rev only	Detect negative frequencies only

RFC-A

The *Rated Frequency* (00.047) and *Rated Speed* (00.045) are used to define the rated slip of the motor. The rated slip is used in sensorless mode (*Sensorless Mode Active* (03.078) = 1) to correct the motor speed with load. When this mode is active *Rated Speed Optimisation Select* (00.033) has no effect.

If sensorless mode is not active (Sensorless Mode Active (03.078) = 0) the rated slip is used in the motor control algorithm and an incorrect value of slip can have a significant effect on the motor performance. If Rated Speed Optimisation Select (00.033) = 0 then the adaptive control system is disabled. However, if Rated Speed Optimisation Select (00.033) is set to a non-zero value the drive can automatically adjust the Rated Speed (00.045) to give the correct value of rated slip. Rated Speed (00.045) is not saved at power-down, and so when the drive is powered-down and up again it will return to the last value saved by the user. The rate of convergence and the accuracy of the adaptive controller reduces at low output frequency and low load. The minimum frequency is defined as a percentage of Rated Frequency (00.047) by Rated Speed Optimisation Minimum Frequency (05.019). The minimum load is defined as a percentage of rated load by Rated Speed Optimisation Minimum Load (05.020). The adaptive controller is enabled when a motoring or regenerative load rises above Rated Speed Optimisation Minimum Load (05.020) + 5 %, and is disabled again when it falls below Rated Speed Optimisation Minimum Load (05.020). For best optimisation results the correct values of Stator Resistance (05.017), Transient Inductance (05.024), Stator Inductance (05.025), Saturation Breakpoint 1 (05.029), Saturation Breakpoint 2 (05.062), Saturation Breakpoint 3 (05.030) and Saturation Breakpoint 4 (05.063) should be used.

* Only applicable to Unidrive M701.

This parameter defines the communications protocol used by the EIA485 comms port on the drive. This parameter can be changed via the drive keypad, via a Solutions Module or via the comms interface itself. If it is changed via the comms interface, the response to the command uses the original protocol. The master should wait at least 20 ms before send a new message using the new protocol. (Note: ANSI uses 7 data bits, 1 stop bit and even parity; Modbus RTU uses 8 data bits, 2 stops bits and no parity).

The core drive always uses the Modbus rtu protocol and is always a slave. *Serial Mode* (00.035) defines the data format used by the serial comms interface. The bits in the value of *Serial Mode* (00.035) define the data format as follows. Bit 3 is always 0 in the core product as 8 data bits are required for Modbus rtu. The parameter value can be extended in derivative products which provide alternative communications protocols if required.

Bits	3	2	1 and 0
Format	Number of data bits 0 = 8 bits 1 = 7 bits	0 = Standard	Stop bits and Parity 0 = 2 stop bits, no parity 1 = 1 stop bit, no parity 2 = 1 stop bit, even parity 3 = 1 stop bit, odd parity

Bit 2 selects either standard or modified register mode. The menu and parameter numbers are derived for each mode as given in the following table. Standard mode is compatible with Unidrive SP. Modified mode is provided to allow register numbers up to 255 to be addressed. If any menus with numbers above 63 should contain more than 99 parameters, then these parameters cannot be accessed via Modbus rtu.

Register mode	Register address
Standard	$(mm \times 100) + ppp - 1$ where $mm \le 162$ and $ppp \le 99$
Modified	(mm x 256) + ppp - 1 where mm \leq 63 and ppp \leq 255

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

These parameters control the proportional and integral gains of the current controller used in the open loop drive. The current controller either provides current limits or closed loop torque control by modifying the drive output frequency. The control loop is also used in its torque mode during line power supply loss, or when the controlled mode standard ramp is active and the drive is decelerating, to regulate the flow of current into the drive.

Open-Loop

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary test measures the *Stator Resistance* (05.017), *Transient Inductance* (05.024), *Maximum Deadtime Compensation* (05.059) and *Current At Maximum Deadtime Compensation* (05.060) which are required for good performance in vector control modes (see *Open Loop Control Mode* (00.007), later in this table). The stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. To perform a Stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 31 on *Unidrive M700 / M701* and terminal 11 and 13 on *Unidrive M702*) and a run signal (terminal 26 or 27 on *Unidrive M700 / M701* and terminal 7 or 8 on *Unidrive M702*).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, as above, then a rotating test is performed in which the motor is accelerated with currently selected ramps up to a frequency of *Rated Frequency* (05.006) x 2/3, and the frequency is maintained at that level for 4 seconds. *Stator Inductance* (05.025) is measured and this value is used in conjunction with other motor parameters to calculate *Rated Power Factor* (00.043). To perform a Rotating autotune, set Pr **00.040** to 2, and provide the drive with both an enable signal (terminal 31 on *Unidrive M700 / M701* and terminal 11 & 13 on *Unidrive M702*) and a run signal (terminal 26 or 27 on *Unidrive M700 / M701* and terminal 7 or 8 on *Unidrive M702*).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 31 on *Unidrive M700 / M701* and terminal 11 & 13 on *Unidrive M702*, setting the *Drive Enable* (06.015) to OFF (0) or disabling the drive via the *Control Word* (06.042) and *Control Word Enable* (06.043).

RFC-A

There are four autotune tests available in RFC-A mode, a stationary test, a rotating test, two mechanical load measurement tests. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. A mechanical load measurement test should be performed separately to a stationary or rotating autotune.

NOTE

It is highly recommended that a rotating autotune is performed (Pr **00.040** set to 2).

 A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary autotune measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr **00.043**. To perform a Stationary autotune, set Pr **00.040** to 1, and provide the drive with both an enable signal (terminal 31 on *Unidrive M700 / M701* and terminal 11 & 13 on *Unidrive M702*) and a run signal (terminal 26 or 27 on *Unidrive M700 / M701* and terminal 7 or 8 on *Unidrive M702*).

A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, a rotating test is then performed which the motor is accelerated with currently selected ramps up to a frequency of *Rated Frequency* (00.047) x 2/3, and the frequency is maintained at the level for up to 40 s. During the rotating autotune the *Stator Inductance* (05.025), and the motor saturation breakpoints (Pr 05.029, Pr 05.030, Pr 06.062 and Pr 05.063) are modified by the drive. The *Motor Rated Power Factor* (00.043) is also modified by the *Stator Inductance* (05.025). The No-Load motor core losses are measured and written to *No-Load Core Loss* (04.045). To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 31 on *Unidrive M700 / M701* and terminal 11 and 13 on *Unidrive M702*) and a run signal (terminal 26 or 27 on *Unidrive M700 / M701* and terminal 7 or 8 on *Unidrive M702*).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 31 on *Unidrive M700 / M701* and terminal 11 and 13 on *Unidrive M702*, setting the *Drive Enable* (06.015) to OFF (0) or disabling the drive via the control word (Pr **06.042** & Pr **06.043**).

RFC-S

There are five autotune tests available in RFC-S mode, a stationary autotune, a rotating autotune, two mechanical load measurement tests and a locked rotor test to measure load dependent parameters.

Stationary Autotune

The stationary autotune can be used when the motor is loaded and it is not possible uncouple the load from motor shaft. This test can be used to measure all the necessary parameters for basic control. During the stationary autotune, a test is performed to locate the flux axis of the motor. However this test may not be able to calculate such an accurate value for the Position Feedback Phase Angle (00.043) as compared to rotating autotune. A stationary test is performed to measure Stator Resistance (05.017), Ld (05.024), Maximum Deadtime Compensation (05.059), Current At Maximum Deadtime Compensation (05.060), No Load Lq (05.072). If Enable Stator Compensation (05.049) = 1 then Stator Base Temperature (05.048) is made equal to Stator Temperature (05.046). The Stator Resistance (05.017) and the Ld (05.024) are then used to set up Current controller Kp Gain (00.038) and Current Controller Ki Gain (00.039). If sensorless mode is not selected then Position Feedback Phase Angle (00.043) is set up for the position from the position feedback interface selected with Motor Control Feedback Select (03.026). To perform a Stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).

Rotating Autotune

The rotating autotune must be performed on unloaded motor. This test can be used to measure all the necessary parameters for the basic control and parameters for cancelling the effects of the cogging torque.

During the rotating autotune, *Rated Current* (00.046) is applied and the motor is rotated by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the required direction. If sensorless mode is not selected then the *Position Feedback Phase Angle* (00.043) is set-up for the position from the position feedback interface selected with *Motor Control Feedback Select* (03.026). A stationary test is then performed to measure *Stator Resistance* (05.017), *Ld* (05.024), *Maximum Deadtime Compensation* (05.059), *Current At Maximum Deadtime Compensation* (05.060) and *No Load Lq* (05.072). *Stator Resistance* (05.017) and *Ld*

1	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication		Onboard PLC	Advanced parameters	Diagnostics	UL information
										-	-			

(05.024) are used to set up *Current Controller Kp Gain* (00.038) and *Current Controller Ki Gain* (00.039). This is only done once during the test, and so the user can make further adjustments to the current controller gains if required. To perform a Rotating autotune, set Pr **00.040** to 2, and provide the drive with both an enable signal (terminal 31 on *Unidrive M700 / M701* and terminal 11 and 13 on *Unidrive M702*) and a run signal (terminal 26 or 27 on *Unidrive M700 / M701* and terminal 7 or 8 on *Unidrive M702*).

00 {05	.04 .01		Maxin	Maximum Switching Frequency							
RW		Txt				R	A	NC			
OL			Hz (0), Hz (2),			₽		:	3 kHz	(1)	
RFC-A	ΰ		⊓z (z), Iz (4), '		· · ·				-	()	
RFC-S				Ð			6 kHz	(3)			

This parameter defines the required switching frequency. The drive may automatically reduce the actual switching frequency (without changing this parameter) if the power stage becomes too hot. A thermal model of the IGBT junction temperature is used based on the heatsink temperature and an instantaneous temperature drop using the drive output current and switching frequency. The estimated IGBT junction temperature is displayed in Pr **07.034**. If the temperature exceeds 135 °C the switching frequency is reduced if this is possible (i.e >3 kHz). Reducing the switching frequency reduces the drive losses and the junction temperature displayed in Pr **07.034** also reduces. If the load condition persists the junction temperature may continue to rise again above 145 °C and the drive cannot reduce the switching frequency further the drive will initiate an 'OHt Inverter' trip. Every second the drive will attempt to restore the switching frequency to the level set in Pr **00.041**.

The full range of switching frequencies is not available on all ratings of Unidrive M. See section 8.5 *Switching frequency* on page 109, for the maximum available switching frequency for each drive rating.

6.4.7 Motor parameters

00.042	{05	.011}	Number Of Motor Poles								
RW		Num								US	
OL	^	Δ	utomatic (0) to			ل		Au	ıtomat	ic (0)	
RFC-A	Û			es (240							
RFC-S						₽		6	Poles	s (3)	

Open-loop

This parameter is used in the calculation of motor speed, and in applying the correct slip compensation. When Automatic (0) is selected, the number of motor poles is automatically calculated from the *Rated Frequency* (00.047) and the *Rated Speed* rpm (00.045). The number of poles = 120 * rated frequency / rpm rounded to the nearest even number.

RFC-A

This parameter must be set correctly for the vector control algorithms to operate correctly. When Automatic (0) is selected, the number of motor poles is automatically calculated from the *Rated Frequency* (00.047) and the *Rated Speed* (00.045) rpm. The number of poles = $120 \times 120 \times 1$

RFC-S

This parameter must be set correctly for the vector control algorithms to operate correctly. When Automatic (0) is selected the number of poles is set to 6.

00.043 {	[05.	010}	Rateo	ated Power Factor (OL)									
00.043 {	03.	025}	Posit	ion Fe	edbad	ck F	hase Ang	gle (RF	C)				
RW		Num							US				
OL	ţ	C	0.000 te	o 1.00	0	₽		0.85	0				
RFC-A	ţ	C	0.000 to 1.000					0.85	0				
RFC-S	ţ	(0.0 to 3	359.9	0	₽		0.0	þ				

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current.

Open-loop

The power factor is used in conjunction with the motor rated current (Pr **00.046**) to calculate the rated active current and magnetizing current of the motor. The rated active current is used extensively to control the drive, and the magnetizing current is used in vector mode Rs compensation. It is important that this parameter is set up correctly.

This parameter is obtained by the drive during a rotational autotune. If a stationary autotune is carried out, then the nameplate value should be entered in Pr **00.043**.

RFC-A

If the stator inductance (Pr **05.025**) contains a non-zero value, the power factor used by the drive is continuously calculated and used in the vector control algorithms (this will not update Pr **00.043**).

If the stator inductance is set to zero (Pr **05.025**) then the power factor written in Pr **00.043** is used in conjunction with the motor rated current and other motor parameters to calculate the rated active and magnetizing currents which are used in the vector control algorithm.

This parameter is obtained by the drive during a rotational autotune. If a stationary autotune is carried out, then the nameplate value should be entered in Pr **00.043**.

RFC-S

The phase angle between the rotor flux in a servo motor and the encoder position is required for the motor to operate correctly. If the phase angle is known it can be set in this parameter by the user. Alternatively the drive can automatically measure the phase angle by performing a phasing test (see autotune in RFC-S mode Pr **00.040**). When the test is complete the new value is written to this parameter. The encoder phase angle can be modified at any time and becomes effective immediately. This parameter has a factory default value of 0.0 °, but is not affected when defaults are loaded by the user.

RFC-S	$\hat{\mathbb{V}}$				•	⇒		3	000.00	rpm	

Open-loop

This is the speed at which the motor would rotate when supplied with its base frequency at rated voltage, under rated load conditions (= synchronous speed - slip speed). Entering the correct value into this parameter allows the drive to increase the output frequency as a

	ĺ	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
--	---	-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	----------------------	--------------	---------------------	----------------------------	----------------	------------------------	-------------	-------------------

function of load in order to compensate for this speed drop.

Slip compensation is disabled if Pr 00.045 is set to 0 or to synchronous speed, or if Pr 05.027 is set to 0.

If slip compensation is required this parameter should be set to the value from the rating plate of the motor, which should give the correct rpm for a hot machine. Sometimes it will be necessary to adjust this when the drive is commissioned because the nameplate value may be inaccurate. Slip compensation will operate correctly both below base speed and within the field weakening region. Slip compensation is normally used to correct for the motor speed to prevent speed variation with load. The rated load rpm can be set higher than synchronous speed to deliberately introduce speed droop. This can be useful to aid load sharing with mechanically coupled motors.

RFC-A

Rated speed is used with motor rated frequency to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter can result in the following:

- Reduced efficiency of motor operation
- Reduction of maximum torque available from the motor
- Failure to reach maximum speed
- Over-current trips
- Reduced transient performance
- Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot machine, however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate.

The rated speed rpm can be optimized by the drive (For further information, refer to section 8.1.2 *RFC-A mode* on page 98).

RFC-S

Rated Speed (00.045) is used as follows:

- 1. Operation without position feedback, i.e. Sensorless Mode Active (03.078) = 1.
- 2. Where the motor operates above this speed and flux weakening is active.
- 3. In the motor thermal model.

The units for *Rated Speed* (00.045) are always rpm even if a linear motor is used and *Linear Speed Select* (01.055) = 1.

00.051	{10	.037}	7} Action On Trip Detection								
RW		Bin								US	
OL											
RFC-A	ţ		0 tc	31		⇒			0		
RFC-S											

Each bit in this parameter has the following functions:

Bit	Function
0	Stop on non-important trips
1	Disable braking resistor overload detection
2	Disable phase loss stop
3	Disable braking resistor temperature monitoring
4	Disable parameter freeze on trip

Example

Pr 00.051 =8 (1000_{binary}) Th Brake Res trip is disabled

Pr 00.051 =12 (1100_{binary}) Th Brake Res and phase loss trip is disabled

Stop on non-important trips

If bit 0 is set to one the drive will attempt to stop before tripping if any of the following trip conditions are detected: I/O Overload, An Input 1 Loss, An Input 2 Loss or Keypad Mode.

Disable braking resistor overload detection

For details of braking resistor overload detection mode see Pr 10.030.

Disable phase loss trip

Normally the drive will stop when the input phase loss condition is detected. If this bit is set to 1 the drive will continue to run and will only trip when the drive is brought to a stop by the user.

Disable braking resistor temperature monitoring

Size 3, 4 and 5 drives have an internal user install braking resistor with a thermistor to detect overheating of the resistor. As default bit 3 of Pr **00.051** is set to zero, and so if the braking resistor and its thermistor is not installed the drive will produce a trip (Th Brake Res) because the thermistor appears to be open-circuit. This trip can be disabled so that the drive can run by setting bit 3 of Pr **00.051** to one. If the resistor is installed then no trip is produced unless the thermistor fails, and so bit 3 of Pr **00.051** can be left at zero. This feature only applies to size 3, 4 and 5 drives. For example if Pr **00.051** = 8, then Th Brake Res trip will be disabled.

Disable parameter freeze on trip

If this bit is 0 then the parameters listed below are frozen on trip until the

trip is cleared. If this bit is 1 then this feature is disabled.

Open-loop mode	RFC-A and RFC-S modes

---	------------------------	-------------	-------------------

7 Running the motor

This chapter takes the new user through all the essential steps to running a motor for the first time, in each of the possible operating modes.

For information on tuning the drive for the best performance, see *Chapter 8 Optimization* on page 95.

Ensure that no damage or safety hazard could arise from the motor starting unexpectedly.

The values of the motor parameters affect the protection of the motor.

The default values in the drive should not be relied upon. It is essential that the correct value is entered in Pr **00.046** *Rated Current.* This affects the thermal protection of the motor.

If the drive is started using the keypad it will run to the speed defined by the keypad reference (Pr **01.017**). This may not be acceptable depending on the application. The user must check in Pr **01.017** and ensure that the keypad reference has been set to 0.

If the intended maximum speed affects the safety of the machinery, additional independent over-speed protection must be used.

7.1 Quick start connections

7.1.1 Basic requirements

This section shows the basic connections which must be made for the drive to run in the required mode. For minimal parameter settings to run in each mode please see the relevant part of section 7.3 *Quick start commissioning / start-up* on page 78.

Table 7-1 Minimum control connection requirements for each control mode

Drive control method	Requirements
Terminal mode	Drive enable Speed / Torque reference Run forward / Run reverse
Keypad mode	Drive enable
Communications link	Drive enable Communications link

Table 7-2 Minimum control connection requirements for each mode of operation

Operating mode	Requirements
Open loop mode	Induction motor
RFC – A mode (with speed feedback)	Induction motor with speed feedback
RFC - S mode (with speed and position feedback)	Permanent magnet motor with speed and position feedback

Speed feedback

Suitable devices are:

- Incremental encoder (A, B or F, D with or without Z)
- Incremental encoder with forward and reverse outputs (F, R with or without Z)
- SINCOS encoder (with, or without Stegmann Hiperface, EnDat or SSI communications protocols)
- EnDat absolute encoder
- Resolver

Speed and position feedback

Suitable devices are:

- Incremental encoder (A, B or F, D with or without Z) with commutation signals (U, V, W)
- Incremental encoder with forward and reverse outputs (F, R with or without Z) and commutation outputs (U, V, W)
- SINCOS encoder (with Stegmann Hiperface, EnDat or SSI communications protocols)
- EnDat absolute encoder
- Resolver

7.2 Changing the operating mode

Changing the operating mode returns all parameters to their default value, including the motor parameters. *User Security Status* (Pr 00.049) and *User Security Code* (Pr 00.034) are not affected by this procedure).

Procedure

Use the following procedure only if a different operating mode is required:

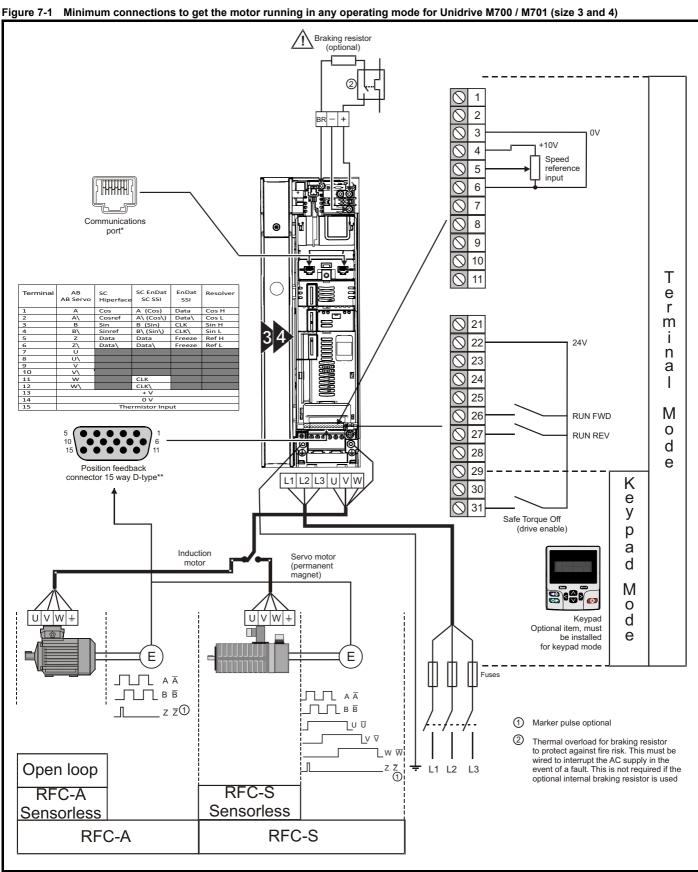

- 1. Enter either of the following values in Pr **mm.000**, as appropriate: 1253 (50 Hz AC supply frequency)
- 1254 (60 Hz AC supply frequency)
 Change the setting of Pr 00.048 as follows:

Pr 00.048 setting		Operating mode
00.048 t Open-loop	1	Open-loop
00.048 \$ RFC-A	2	RFC-A
00.048 ‡ RFC-S	3	RFC-S
00.048 t Regen	4	Regen

The figures in the second column apply when the communications interface is used.

- 3. Either:
- Press the red 😡 reset button
- Toggle the reset digital input
- Carry out a drive reset through the communications interface by setting Pr 10.038 to 100 (ensure that Pr. mm.000 returns to 0).

7.3 Quick start commissioning / start-up

7.3.1 Open loop

Action	Detail	
Before power-up	 Ensure: The drive enable signal is not given (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702). Run signal is not given Motor is connected 	×
Power-up the drive	 Verify that Open Loop mode is displayed as the drive powers up. If the mode is incorrect see section 5.6 <i>Changing the operating mode</i> on page 45. Ensure: Drive displays 'Inhibit' If the drive trips, see section 13 <i>Diagnostics</i> on page 245. 	[7]
Enter motor nameplate details	 Enter: Motor rated frequency in Pr 00.047 (Hz) Motor rated current in Pr 00.046 (A) Motor rated speed in Pr 00.045 (rpm) Motor rated voltage in Pr 00.044 (V) - check if	Mot X XXXXXXXX kg No XXXXXXXXX kg 1955 1.6F C 40 \$ \$1 - V
Set maximum frequency	Enter: • Maximum frequency in Pr 00.002 (Hz)	0.02
Set acceleration / deceleration rates	 Enter: Acceleration rate in Pr 00.003 (s/100 Hz) Deceleration rate in Pr 00.004 (s/100 Hz) (If braking resistor installed, set Pr 00.015 = Fast. Also ensure Pr 10.030 and Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen). 	100Hz
Motor thermistor set-up	The motor thermistor connection is made through the drive encoder port (terminal 15). The thermistor type is selected in <i>P1 Thermistor Type</i> (03.118). On Unidrive M700 / M701, the motor thermistor can be selected in Pr 07.015 . Refer to Pr 07.015 for further information.	— <u> </u>
	The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive. A rotating autotune will cause the motor to accelerate up to ² / ₃ base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference. The drive can be stopped at any time by removing the run signal or removing the drive enable.	
Autotune	 A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. A stationary autotune measures the stator resistance and the transient inductance in the motor. These are required for good performance in vector control modes. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. A rotating autotune should only be used if the motor is uncoupled. A rotating autotune first performs a stationary autotune before rotating the motor at 2/3 base speed in the direction selected. The rotating autotune measures the power factor of the motor. To perform an autotune: Set Pr 00.040 = 1 for a stationary autotune or set Pr 00.040 = 2 for a rotating autotune Close the Drive Enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702). The drive will display 'Ready'. Close the run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702). The upper row of the display will flash 'Auto Tune' while the drive is performing the autotune. Wait for the drive to display 'Ready' or 'Inhibit' and for the motor to come to a standstill. If the drive trips, see Chapter 13 <i>Diagnostics</i> on page 245. 	
Save parameters	Remove the drive enable and run signal from the drive. Select 'Save Parameters' in Pr mm.000 (alternatively enter a value of 1001 in Pr mm.000) and press the red The red	
Run	Drive is now ready to run	* O

7.3.2 RFC - A mode (with position feedback)

Induction motor with position feedback

For simplicity only an incremental quadrature encoder will be considered here. For information on setting up one of the other supported speed feedback devices, refer to section 7.3.5 *RFC-Sensorless* on page 83.

Action	Detail	
Before power-up	 Ensure: The drive enable signal is not given (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702). Run signal is not given Motor and feedback device are connected 	×
Power-up the drive	 Verify that RFC-A mode is displayed as the drive powers up. If the mode is incorrect see section 5.6 Changing the operating mode on page 45. Ensure: Drive displays 'Inhibit' If the drive trips, see Chapter 13 Diagnostics on page 245. 	[]
Set motor feedback parameters	Incremental encoder basic set-up Enter: Drive encoder type in Pr 03.038 = AB (0): Quadrature encoder Encoder power supply in Pr. 03.036 = 5 V (0), 8 V (1) or 15 V (2). NOTE If output voltage from the encoder is >5 V, then the termination resistors must be disabled Pr 03.039 to 0. Setting the encoder voltage supply too high for the encoder could result in damage to the feedback device. CAUTION • Drive encoder Lines Per Revolution (LPR) in Pr 03.034 (set according to encoder) • Drive encoder termination resistor setting in Pr 03.039: 0 = A-A B-B Z-Z\ termination resistors enabled, Z-Z\ termination resistors disabled 1 = A-A B-B Z-Z\ termination resistors enabled	
Enter motor nameplate details	 Motor rated frequency in Pr 00.047 (Hz) Motor rated current in Pr 00.046 (A) Motor rated speed in Pr 00.045 (rpm) Motor rated voltage in Pr 00.044 (V) - check if 人 or ∆ connection 	
Set maximum speed	Enter: Maximum speed in Pr 00.002 (rpm)	0.02
Set acceleration / deceleration rates	 Enter: Acceleration rate in Pr 00.003 (s/1000 rpm) Deceleration rate in Pr 00.004 (s/1000 rpm) (If braking resistor installed, set Pr 00.015 = Fast. Also ensure Pr 10.030, Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen). 	
Motor thermistor set-up	The motor thermistor connection is made through the drive encoder port (terminal 15). The thermistor type is selected in <i>P1 Thermistor Type</i> (03.118). On Unidrive M700 / M701, the motor thermistor can be selected in Pr 07.015 . Refer to Pr 07.015 for further information.	
	The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. A rotating autotune will cause the motor to accelerate up to ² / ₃ base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference. The drive can be stopped at any time by removing the run signal or removing the drive enable.	
Autotune	 A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. The stationary autotune measures the stator resistance and transient inductance of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. A rotating autotune should only be used if the motor is uncoupled. A rotating autotune first performs a stationary autotune before rotating the motor and calculates the power factor. To perform an autotune: Set Pr 00.040 = 1 for a stationary autotune or set Pr 00.040 = 2 for a rotating autotune Close the drive enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702). The drive will display 'Ready'. Close the run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702). The upper row of the display will flash 'Auto Tune' while the drive is performing the autotune. Wait for the drive to display 'Ready' or 'Inhibit' and for the motor to come to a standstill. If the drive trips, see Chapter 13 <i>Diagnostics</i> on page 245. Remove the drive enable and run signal from the drive. 	Re dLs Nm Nrpm
Save parameters	Select 'Save Parameters' in Pr mm.000 (alternatively enter a value of 1001 in Pr mm.000) and press red () reset button or toggle the reset digital input.	
Run	Drive is now ready to run	÷ O

7.3.3 RFC-A mode (Sensorless control) Induction motor with sensorless control

Action	Detail	
Before power-up	 Ensure: The drive enable signal is not given (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702). Run signal is not given Motor is connected 	×
Power-up the drive	 Verify that RFC-A mode is displayed as the drive powers up. If the mode is incorrect see section 5.6 <i>Changing the operating mode</i> on page 45. Ensure: Drive displays 'Inhibit' If the drive trips, see Chapter 13 <i>Diagnostics</i> on page 245. 	
Select RFC-A (Sensorless control) mode and disable encoder wire- break trip	 Set Pr 03.024 = 1 or 3 to select RFC-A Sensorless mode Set Pr 03.040 = 0000 to disable the wire break 	
Enter motor nameplate details	 Enter: Motor rated frequency in Pr 00.047 (Hz) Motor rated current in Pr 00.046 (A) Motor rated speed in Pr 00.045 (rpm) Motor rated voltage in Pr 00.044 (V) - check if	
Set maximum speed	Enter: Maximum speed in Pr 00.002 (rpm) 	0.02
Set acceleration / deceleration rates	 Enter: Acceleration rate in Pr 00.003 (s/1000rpm) Deceleration rate in Pr 00.004 (s/1000rpm) (If braking resistor installed, set Pr 00.015 = Fast. Also ensure Pr 10.030, Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen). 	1000pm
Motor thermistor set-up	The motor thermistor connection is made through the drive encoder port (terminal 15). The thermistor type is selected in <i>P1 Thermistor Type</i> (03.118). On Unidrive M700 / M701, the motor thermistor can be selected in Pr 07.015 . Refer to Pr 07.015 for further information.	— <u> </u>
Select or deselect catch a spinning motor mode	If catch a spinning motor mode is not required then set Pr 06.009 to 0. If catch a spinning motor mode is required then leave Pr 06.009 at the default of 1, but depending on the size of the motor the value in Pr 05.040 may need to be adjusted. Pr 05.040 defines a scaling function used by the algorithm that detects the speed of the motor. The default value of Pr 05.040 is 1 which is suitable for small motors (<4 kW). For larger motors the value in Pr 05.040 will need to be increased. Approximate values of Pr 05.040 for different motor sizes are as follows, 2 for 11 kW, 3 for 55 kW and 5 for 150 kW. If the value of Pr 05.040 is too large the motor may accelerate from standstill when the drive is enabled. If the value of this parameter is too small the drive will detect the motor speed as zero even if the motor is spinning.	
	The drive is able to perform either a stationary or a rotating autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. NOTE It is highly recommended that a rotating autotune is performed (Pr 00.040 set to 2).	
Autotune	 A rotating autotune will cause the motor to accelerate up to ²/₃ base speed in the direction selected regardless of the reference provided. Once complete the motor will coast to a stop. The enable signal must be removed before the drive can be made to run at the required reference. The drive can be stopped at any time by removing the run signal or removing the drive enable. A stationary autotune can be used when the motor is loaded and it is not possible to uncouple the load from the motor shaft. The stationary autotune measures the stator resistance and transient inductance of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. A rotating autotune before rotating the motor at 2/3 base speed in the direction selected. The rotating autotune measures the stator resistance and transient inductance of the motor so the value on the motor an autotance of the motor and calculates the power factor. To perform an autotune before rotating the motor at 2/3 base speed in the direction selected. The rotating autotune measures the stator inductance of the motor and calculates the power factor. Set Pr 00.040 = 1 for a stationary autotune or set Pr 00.040 = 2 for a rotating autotune Close the drive enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702). The drive will display 'Ready' or 'Inhibit'. Close the run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702). The upper row of the display will flash 'Auto Tune' while the drive is performing the autotune. Wait for the drive to display 'Ready' or 'Inhibit' and for the motor to come to a standstill. If the drive trips, see Chapter 13 <i>Diagnostics</i> on page 245. Remove	R _c dL _s T Nm Nm Nm Nm Nm Nrpm

7.3.5 RFC-Sensorless

Permanent magnet motor without position feedback

Action	Detail	
Before power- up	 Ensure: The drive enable signal is not given (terminal 31 on Unidrive M700/M701 and terminal 11 & 13 on Unidrive M702). Run signal is not given Motor is connected 	\times
Power-up the drive	 Verify that RFC-S mode is displayed as the drive powers up. If the mode is incorrect see section 5.6 <i>Changing the operating mode</i> on page 45, otherwise restore parameter defaults (see section 5.8 <i>Restoring parameter defaults</i> on page 45). Ensure: Drive displays 'inhibit' If the drive trips, see Chapter 13 <i>Diagnostics</i> on page 245. 	
Enter motor nameplate details	 Enter: Motor rated current in Pr 00.046 (A) Ensure that this equal to or less than the Heavy Duty rating of the drive otherwise 'Motor Too Hot' trips may occur during the autotune. Number of poles in Pr 00.042 Motor rated voltage in Pr 00.044 (V) 	Ender En
Set maximum speed	Enter: • Maximum speed in Pr 00.002 (rpm)	8.00
Set acceleration / deceleration rates	 Enter: Acceleration rate in Pr 00.003 (s/1000 rpm). It is recommended that the ramp rates are increased from the default value of 0.200 s/1000 rpm. Deceleration rate in Pr 00.004 (s/1000 rpm) (If braking resistor installed, set Pr 00.015 = Fast. Also ensure Pr 10.030, Pr 10.031 and Pr 10.061 are set correctly, otherwise premature 'Brake R Too Hot' trips may be seen). 	
Set stop mode	Enter: Set Stop Mode to Ramp in Pr 06.001	
Set hold zero speed	Enter: Set Hold Zero Speed to Off (0) in Pr 06.008 .	
Autotune	 The drive is able to perform a stationary autotune. The motor must be at a standstill before an autotune is enabled. A stationary autotune will give moderate performance. A stationary autotune is performed to locate the flux axis of the motor. The stationary autotune measures the stator resistance, inductance in flux axis, inductance in torque axis with no load on the motor and values relating to deadtime compensation from the drive. Measured values are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. To perform an autotune: Set Pr 00.040 = 1 or 2 for a stationary autotune. (Both perform the same tests). Close the run signal (terminal 26 or 27 on Unidrive M700/M701 and terminal 7 or 8 on Unidrive M702). Close the drive enable signal (terminal 31 on Unidrive M700/M701 and terminal 11 & 13 on Unidrive M702). The upper row of the display will flash 'Auto Tune' while the drive is performing the test. Wait for the drive to display 'Ready' or 'Inhibit' and for the motor to come to a standstill. If the drive trips it cannot be reset until the drive enable signal (terminal 31) has been removed. See Chapter 13 <i>Diagnostics</i> on page 245. Remove the drive enabled and run signal from the drive. 	Re E Ld No-load Lq
Check Saliency	In sensorless mode, when the motor speed is below Pr 00.045 / 10, a special low speed algorithm must be used to control the motor. There are two modes available, with the mode chosen based on the saliency of the motor. The ratio No-load Lq (Pr 00.056) / Ld (Pr 05.024) provides a measure of the saliency. If this value is > 1.1, then Injection (0) mode may be used. Current (2) mode may be used (but with limitations). If this value is < 1.1, then Current (2) mode must be used (this is the default of Pr 05.064).	
Save parameters	Select 'Save Parameters' in Pr mm.000 (alternatively enter a value of 1001 in Pr mm.000) and press red () reset button or toggle the reset digital input.	
Run	Drive is now ready to run	· Or

The line delay is me during initialisation, and is used to compensate this delay during communications with the encoder. Therefore there is no timing based restriction on the length of the cable between the position feed interface and the encoder. However, care should be taken to ensure that the wiring arrangement a type of cable used are suitable for the selected baud rate and the distance between the position in and the encoder. See <i>P1 Low Speed Update Rate Active</i> (03.063) in the <i>Parameter Reference Gr</i> more details on timing restrictions related to the drive sample times. The calculation time (t _{cal}) may be longer than the default given in parameter 03.060. This time is not								ncode n feed ment a sition ir	r. back and the nterface

				The CRC polynomial and rotary turns and position padding need to be configured in this parameter. This information should be available on the encoder datasheet. <i>P1 Additional Configuration</i> (03.074) provides configuration information, not covered by the other set-up parameters, for the position feedback device connected to the P1 position feedback interface and is specific to the type of device being used. This parameter is split into 3 fields as shown below.											
				Decimal D	igits	9-6		5-3		2-0					
					-	CRC	polynomia	I Rotary	Turns Padding	Rotar	y Positio	n Pado	ling		
				Commonly	used val	ue 0067		000		000	-				
P1 Additional Configuration (03.074)			.074)	 CRC polynomial The CRC polynomial is a bit representation of the terms of a polynomial used to generate the CRC applied to the position and the additional data transferred to/from the encoder via the BiSS communications channel. The standard value is 0067 which in hexadecimal is 0x0043, or in binary form is 0000 0000 0100 0011. The bits that are set to one show which terms exist in the polynomial. The standard value has bits 6, 1 and 0 set to one and gives the polynomial normally used with BiSS encoders which is X⁶+X¹+1. If the encoder uses a different polynomial then this can be selected with the four digits (9-6). The maximum value is 511 (0x01FF), and so a polynomial up to degree 10 can be set up. Rotary Turns Padding and Rotary Position Padding The turns, and position within a turn, provided by a rotary encoder may not completely fill the number of bits provided. The unfilled bits will be padded with zeros. The total number of bits provided for the turns

Supply Voltage (03.036)	5 V (0), 8 V (1) or 15 V (2)
Error Detection Level (03.040)	Set to zero to disable wire break detection

* This feedback device provides very low resolution feedback and should not be used for applications requiring a high level of performance.

Due to the low resolution of UVW communication only encoders, it is recommended that the *P1 Feedback Filter* (03.042) is set to its maximum value. A value of 1 ms to 2 ms may also be required in the *Current Reference Filter* (00.017) and it is also recommended that the speed loop gains are set to a low value to obtain stable operation.

7.4.3 P2 position interface

This section shows the parameter settings which must be made to use each of the compatible feedback device types with the P2 position interface on the drive. For more information on the parameters listed here please refer to the *Parameter Reference Guide*. If the position feedback device connected to the P2 position interface is required to be used for motor control feedback then Pr **03.026** will need to be set to P2 Drive (1).

P2 Auto-configuration Select (03.141)		\checkmark		
P2 Additional Configuration (03.174)				✓

✓ Information required to be entered by the user.

• Parameter can be set-up automatically by the drive through auto-configuration. Parameter must be set by the user if auto-configuration is disabled (i.e. Pr 03.141 = Disabled (0)).

The P2 position interface does not have its own independent power supply output. Therefore, any position feedback device connected to the P2 position interface must either share the P1 power supply output on pin 13 of the 15-way D-type, or be supplied from an external source.

NOTE

The termination resistors are always enabled on the P2 position interface. Wire break detection is not available when using AB, FD or FR position feedback device types on the P2 position interface.

Table 7-4 shows a summary of the parameters required to set-up each feedback device. More detailed information follows.

				Common	y useu vali	0007		000		000					
P2 Additional Configuration (03.174)				CRC polynomial The CRC polynomial is a bit representation of the terms of a polynomial used to generate the CRC applied to the position and the additional data transferred to/from the encoder via the BiSS communications channel. The standard value is 0067 which in hexadecimal is 0x0043, or in binary form is 0000 0000 0100 0011. The bits that are set to one show which terms exist in the polynomial. The standard value has bits 6, 1 and 0 set to one and gives the polynomial normally used with BiSS encoders which is $X^{6}+X^{1}+1$. If the encoder uses a different polynomial then this can be selected with the four digits (9-6). The maximum value is 511 (0x01FF), and so a polynomial up to degree 10 can be set up. Rotary Turns Padding and Rotary Position Padding The turns, and position within a turn, provided by a rotary encoder may not completely fill the number of bits provided. The unfilled bits will be padded with zeros. The total number of bits provided for the turns including zero padding is given by <i>P2 Rotary Turns Bits</i> (03.133). The zero padding is given by decimal digits 5 to 3 of <i>P2 Additional Configuration</i> (03.174). Digits 4 and 3 give the number of bits and digit 5 specifies whether the padding is on the left (0) or on the right (1). For example a value of 104 would specify 4 padding bits on the right of the turns data. The default value of 000 specifies no padding. If the padding value is outside the range +/-16 then an <i>Encoder 14</i> is initiated. The total number of bits provided for position within a turn is given by: P2 Comms Bits (03.135) - P2 Rotary Turns Bits (03.133).

7.5 Encoder Simulation Output Set-up

The drive supports four modes of encoder simulation output.

- Hardware mode Incremental signals (AB, FD, FR)
- Software mode Incremental signals (AB, FD, FR)
- Software mode Ratio
- Software mode Absolute SSI data

The availability of the encoder simulation output on the 15-way D-type on the drive is dependent on the type of feedback device connected to the P1 position interface. See Table 4-9 on page 32 for more information on the availability of the encoder simulation output. The status of the encoder simulation output can be seen in *Encoder Simulation Status* (03.086) as follows:

- None (0) The encoder simulation output is not enabled or is not available
- Full (1) Full encoder simulation with marker output is available
- No Marker (2) Encoder simulation without marker output is available

This section shows the parameter settings which must be made to use the encoder simulation output on the drive. For more information on the parameters listed here please refer to the Parameter Reference Guide.

7.5.1 Hardware mode - Incremental signals (AB, FD, or FR)

Hardware mode provides incremental signals derived via hardware from the P1 position feedback interface on the drive, with negligible delay. The supported incremental output signals are AB, FD and FR. Hardware mode only produces an output when the input device connected to the P1 position interface is AB, FD, FR, SC, SC Hiperface, SC EnDat or SC SSI type devices. It should be noted that with a SINCOS source device the output is based on the zero crossings of the sine wave inputs and does not include interpolation.

Hardware mode set-up						
Encoder Simulation Source (03.085)	This parameter must be set to 03.029 to select the P1 position interface as the source.					
Encoder Simulation Mode (03.088)	Set to a value of Hardware (0)					
Encoder Simulation Hardware Divider (03.089)	This parameter defines the divider ratio between the device connected to the P1 position feedback interface and the output. 0 = 1/1 1 = 1/2 2 = 1/4 3 = 1/8 4 = 1/16 5 = 1/32 6 = 1/64 7 = 1/128					
Encoder Simulation Hardware Marker Lock (03.090)	 0 = The marker output is derived directly from the marker input 1 = The incremental output signals are adjusted on each marker event so that the A and B are high with an AB type output, or F is high with an FD or FR type output 					
Encoder Simulation Output Mode (03.098)	 AB/Gray (0) for a AB quadrature output signals FD/Binary (1) for Frequency and Direction output signals FR/Binary (2) for Forward and Reverse output signals 					

7.5.2 Software mode - Incremental signals (AB, FD, or FR)

In software mode the encoder simulation output is derived via software from the selected source with a minimum delay of 250 µs which may be extended with *Encoder Simulation Sample Period* (03.087). For incremental output signals, the resolution of the output can be defined by either selecting the required output lines per revolution or by an output ratio.

Lines per revolution

The output resolution of the encoder simulation output is defined by Encoder Simulation Output Lines Per Revolution (03.092).

Encoder Simulation Source (03.085)	Set to the parameter number of the position source Pr 03.029 to use the P1 position interface on the drive as the source. Pr 03.129 to use the P2 position interface on the drive as the source. This parameter can be set to any other valid position reference generated by the drive or an option module.
Encoder Simulation Mode (03.088)	Set to a value of Lines Per Rev (1)
Encoder Simulation Output Lines Per Revolution (03.092)	Set to the required output lines per revolution. The maximum output lines per revolution are 16384.
Encoder Simulation Output Mode (03.098)	AB/Gray (0) for a AB quadrature output signals

Ratio

In ratio mode the resolution of the input source is based on a 16 bit position feedback device (i.e. equivalent to an AB quadrature encoder with a resolution of 16384 lines per revolution). The output resolution of the encoder simulation output is defined by the ratio of *Encoder Simulation Numerator* (03.093) and *Encoder Simulation Denominator* (03.094).

AB quadrature output signals, software mode Frequency and Direction or Forward and Rev	
Encoder Simulation Source (03.085)	Set to the parameter number of the position source Pr 03.029 to use the P1 position interface on the drive as the source. Pr 03.129 to use the P2 position interface on the drive as the source. This parameter can be set to any other valid position reference generated by the drive or an option module.
Encoder Simulation Mode (03.088)	Set to a value of Ratio (2)
Encoder Simulation Numerator (03.093) and Encoder Simulation Denominator (03.094)	Set these two parameters to give the required output ratio.
Encoder Simulation Output Mode (03.098)	 AB/Gray (0) for a AB quadrature output signals FD/Binary (1) for Frequency and Direction output signals FR/Binary (2) for Forward and Reverse output signals

Software mode - Absolute SSI data

In software mode the encoder simulation output is derived via software from the selected source with a minimum delay of 250 µs which may be extended with *Encoder Simulation Sample Period* (03.087). In SSI output mode drive will simulate an SSI encoder, where the number of bits and the format of the position message can be adjusted.

Absolute SSI data, software mode setup	
Encoder Simulation Source (03.085)	Set to the parameter number of the position source Pr 03.029 to use the P1 position interface on the drive as the source. Pr 03.129 to use the P2 position interface on the drive as the source. This parameter can be set to any other valid position reference generated by the drive or an option module.
Encoder Simulation Mode (03.088)	Set to a value of SSI (3)
Encoder Simulation SSI Turns Bits (03.096)	Set to the number of bits representing the number of turns in the position message.
Encoder Simulation SSI Comms Bits (03.097)	Set to the number bits in the whole position message.
Encoder Simulation Output Mode (03.098)	AB/Gray (0) for position data in Gray code format FD/Binary (1) or FR/Binary (2) for position data in binary format

8 Optimization

This chapter takes the user through methods of optimizing the drive set-up and maximize the performance. The auto-tuning features of the drive simplify the optimization tasks.

8.1 Motor map parameters

8.1.1 Open loop motor control

Pr 00.046 {05.007} Rated Current	Defines the maximum continuous motor current
	<i>tection</i> on page 108, for more information) later in this table)
Pr 00.044 {05.009} Rated Voltage	Defines the voltage applied to the motor at rated frequency
Pr 00.047 {05.006} Rated Frequency	Defines the frequency at which rated voltage is applied
The <i>Rated Voltage</i> (00.044) and the <i>Rated Frequency</i> (00.047) are used to define the voltage to frequency characteristic applied to the motor (see <i>Open Loop Control Mode</i> (00.007), later in this table). The <i>Rated Frequency</i> (00.047) is also used in conjunction with the motor rated speed to calculate the rated slip for slip compensation (see <i>Rated Speed</i> (00.045), later in this table).	Output voltage characteristic Pr 00.044 / 2 Pr 00.044 / 2 Pr 00.047 / 2 Pr 00.047 Output frequency
Pr 00.045 {05.008} Rated Speed	Defines the full load rated speed of the motor
Pr 00.042 {05.011} Number Of Motor Poles	Defines the number of motor poles
The motor rated speed and the number of poles are used with the motor	rated frequency to calculate the rated slip of induction machines in Hz.
Rated slip (Hz) = Motor rated frequency - (Number of pole pairs x [Mo	otor rated speed / 60]) = 00.047 = $\left(\frac{00.042}{2} \times \frac{00.045}{60}\right)$
than synchronous speed to deliberately introduce speed droop. Pr 00.040 {05.012} Autotune

There are two autotune tests available in open loop mode, a stationary and a rotating test. A rotating autotune should be used whenever possible so the measured value of power factor of the motor is used by the drive.

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary test measures the Stator Resistance (05.017), Transient Inductance (05.024), Maximum Deadtime Compensation (05.059) and Current At Maximum Deadtime Compensation (05.060) which are required for good performance in vector control modes (see Open Loop Control Mode (00.007), later in this table). The stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. To perform a Stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, as above, then a rotating test is performed in which the motor is accelerated with currently selected ramps up to a frequency of *Rated Frequency* (05.006) x 2/3, and the frequency is maintained at that level for 4 seconds. *Stator Inductance* (05.025) is measured and this value is used in conjunction with other motor parameters to calculate *Rated Power Factor* (05.010). To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 31 on *Unidrive M700 / M701* and terminal 11 & 13 on *Unidrive M702*, setting the *Drive Enable* (06.015) to OFF (0) or disabling the drive via the *Control Word* (06.042) and *Control Word Enable* (06.043).

Pr 00.007 {05.014} Open Loop Control Mode

There are several voltage modes available which fall into two categories, vector control and fixed boost.

Vector control

Vector control mode provides the motor with a linear voltage characteristic from 0 Hz to motor *Rated Frequency* (00.047), and then a constant voltage above motor rated frequency. When the drive operates between motor rated frequency/50 and motor rated frequency/4, full vector based stator resistance compensation is applied. When the drive operates between motor rated frequency/4 and motor rated frequency/2 the stator resistance compensation is gradually reduced to zero as the frequency increases. For the vector modes to operate correctly the *Rated Power Factor* (00.043), *Stator Resistance* (05.017) are all required to be set up accurately. The drive can be made to measure these by performing an autotune (see Pr 00.040 *Autotune*). The drive can also be made to measure the stator resistance automatically every time the drive is enabled or the first time the drive is enabled after it is powered up, by selecting one of the vector control voltage modes.

(0) **Ur S** = The stator resistance is measured and the parameter for the selected motor map is over-written each time the drive is made to run. This test can only be done with a stationary motor where the flux has decayed to zero. Therefore this mode should only be used if the motor is guaranteed to be stationary each time the drive is made to run. To prevent the test from being done before the flux has decayed there is a period of 1 second after the drive has been in the ready state during which the test is not done if the drive is made to run again. In this case, previously measured values are used. Ur S mode ensures that the drive compensates for any change in motor parameters due to changes in temperature. The new value of stator resistance is not automatically saved to the drive's EEPROM.

(1) **Ur** = The stator resistance is not measured. The user can enter the motor and cabling resistance into the *Stator Resistance* (05.017). However this will not include resistance effects within the drive inverter. Therefore if this mode is to be used, it is best to use an autotune test initially to measure the stator resistance.

(3) **Ur_Auto** = The stator resistance is measured once, the first time the drive is made to run. After the test has been completed successfully the *Open Loop Control Mode* (00.007) is changed to Ur mode. The *Stator Resistance* (05.017) parameter is written to, and along with the *Open Loop Control Mode* (00.007), are saved in the drive's EEPROM. If the test fails, the voltage mode changes to Ur mode but *Stator Resistance* (05.017) is not updated.

(4) **Ur I** = The stator resistance is measured when the drive is first made to run after each power-up. This test can only be done with a stationary motor. Therefore this mode should only be used if the motor is guaranteed to be stationary the first time the drive is made to run after each power-up. The new value of stator resistance is not automatically saved to the drive's EEPROM.

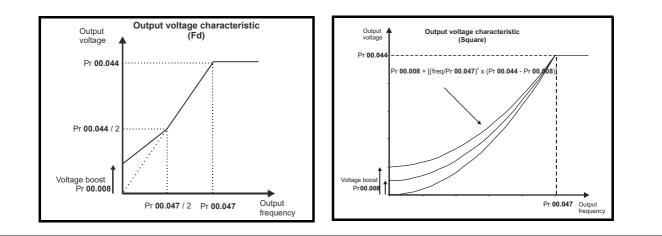

Pr 00.007 {05.014} Open Loop Control Mode (cont)

Fixed boost

The stator resistance is not used in the control of the motor, instead a fixed characteristic with low frequency voltage boost as defined by parameter Pr **00.008**, is used. Fixed boost mode should be used when the drive is controlling multiple motors. There are two settings of fixed boost available: (2) **Fixed** = This mode provides the motor with a linear voltage characteristic from 0 Hz to *Rated Frequency* (00.047), and then a constant voltage above rated frequency.

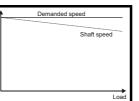

(5) **Square** = This mode provides the motor with a square law voltage characteristic from 0 Hz to *Rated Frequency* (00.047), and then a constant voltage above rated frequency. This mode is suitable for variable torque applications like fans and pumps where the load is proportional to the square of the speed of the motor shaft. This mode should not be used if a high starting torque is required.

For both these modes, at low frequencies (from 0Hz to ½ x Pr 00.047) a voltage boost is applied defined by Pr 00.008 as shown below:

Pr 05.027 Enable Slip Compensation

When a motor, being controlled in open loop mode, has load applied a characteristic of the motor is that the output speed droops in proportion to the load applied as shown:

In order to prevent the speed droop shown above slip compensation should be enabled. To enable slip compensation Pr **05.027** must be set to a 1 (this is the default setting), and the motor rated speed must be entered in Pr **00.045** (Pr **05.008**).

The motor rated speed parameter should be set to the synchronous speed of the motor minus the slip speed. This is normally displayed on the motor nameplate, i.e. for a typical 18.5 kW, 50 Hz, 4 pole motor, the motor rated speed would be approximately 1465 rpm. The synchronous speed for a 50 Hz, 4 pole motor is 1500 rpm, so therefore the slip speed would be 35 rpm. If the synchronous speed is entered in Pr **00.045**, slip compensation will be disabled. If too small a value is entered in Pr **00.045**, the motor will run faster than the demanded frequency. The synchronous speeds for 50 Hz motors with different numbers of poles are as follows:

2 pole = 3000 rpm, 4 pole = 1500 rpm, 6 pole =1000 rpm, 8 pole = 750 rpm

8.1.2 RFC-A mode

Induction motor with Position feedback

Pr 00.046 {05.007} Motor Rated Current

Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. (See section 8.2 *Maximum motor rated current* on page 108, for information about setting this parameter higher than the maximum Heavy Duty current rating.) The motor rated current is used in the following:

- Current limits (see section 8.3 Current limits on page 108, for more information).
- · Motor thermal overload protection (see section 8.4 Motor thermal protection on page 108, for more information)
- Vector control algorithm

Pr 00.044 {05.009} Rated Voltage

Defines the voltage applied to the motor at rated frequency

Pr 00.047 {05.006} Rated Frequency Defines the frequency at which rated voltage is applied The Rated Voltage (00.044) and the Rated Frequency (00.047) are used Output voltage characteristic to define the voltage to frequency characteristic applied to the motor (see Output Open Loop Control Mode (00.007), later in this table). The motor rated voltage frequency is also used in conjunction with the motor rated speed to Pr 00 04 calculate the rated slip for slip compensation (see motor Rated Speed (00.045), later in this table). Pr 00 044 / 2 Output Pr 00.047 / 2 Pr 00.047 Pr 00.045 {05.008} Rated Speed Defines the full load rated speed of the motor Pr 00.042 {05.011} Number Of Motor Poles Defines the number of motor poles The motor rated speed and motor rated frequency are used to determine the full load slip of the motor which is used by the vector control algorithm. Incorrect setting of this parameter has the following effects: Reduced efficiency of motor operation Reduction of maximum torque available from the motor Reduced transient performance Inaccurate control of absolute torgue in torgue control modes The nameplate value is normally the value for a hot motor; however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate. Either a fixed value can be entered in this parameter or an optimization system may be used to automatically adjust this parameter (see Rated Speed Optimisation Select (00.033), later in this table). When Pr 00.042 is set to 'Automatic', the number of motor poles is automatically calculated from the motor Rated Frequency (00.047), and the motor Rated Speed (00.045). Number of poles = 120 x (Motor Rated Frequency (00.047 / Motor Rated Speed (00.045) rounded to the nearest even number.

Pr 00.043 {5.10} Rated Power Factor

Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. If the *Stator Inductance* (05.025) is set to zero then the power factor is used in conjunction with the motor *Rated Current* (00.046) and other motor parameters to calculate the rated active and magnetising currents of the motor, which are used in the vector control algorithm. If the stator inductance has a non-zero value this parameter is not used by the drive, but is continuously written with a calculated value of power factor. The stator inductance can be measured by the drive by performing a rotating autotune (see *Autotune* (Pr 00.040), later in this table).

Pr 00.040 {05.012} Autotune

There are four autotune tests available in RFC-A mode, a stationary autotune, a rotating autotune, two mechanical load measurement tests. A stationary autotune will give moderate performance whereas a rotating autotune will give improved performance as it measures the actual values of the motor parameters required by the drive. A mechanical load measurement test should be performed separately to a stationary or rotating autotune.

NOTE

It is highly recommended that a rotating autotune is performed (Pr 00.040 set to 2).

- A stationary autotune can be used when the motor is loaded and it is not possible to remove the load from the motor shaft. The stationary autotune measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor. These are used to calculate the current loop gains, and at the end of the test the values in Pr 00.038 and Pr 00.039 are updated. A stationary autotune does not measure the power factor of the motor so the value on the motor nameplate must be entered into Pr 00.043. To perform a Stationary autotune, set Pr 00.040 to 1, and provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, a rotating test is then performed which the motor is accelerated with currently selected ramps up to a frequency of *Rated Frequency* (00.047) x 2/3, and the frequency is maintained at the level for up to 40 s. During the rotating autotune the *Stator Inductance* (05.025), and the motor saturation breakpoints (Pr 05.029, Pr 05.030, Pr 06.062 and Pr 05.063) are modified by the drive. The *Motor Rated Power Factor* (00.043) is also modified by the *Stator Inductance* (05.025). The No-Load motor core losses are measured and written to *No-Load Core Losses* (04.045). To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).
 Mechanical load measurement test using signal injection.
- This test measures the mechanical characteristic of the motor and load by rotating the motor at the speed defined by the present speed reference and injecting a series of speed test signals. This test should only be used provided all the basic control parameters have been set-up correctly and the speed controller parameters should be set to conservative levels, such as the default values, so that the motor is stable when it runs. The test measures the motor and load inertia, which can be used in automatic set-up of the speed controller gains and in producing a torque feed-forward term. If *Mechanical Load Test Level* (05.021) is left at its default value of zero then the peak level of the injection signal will be 1 % of the maximum speed reference subject to a maximum of 500 rpm. If a different test level is required then *Mechanical Load Test Level* (05.021) should be set to a non-zero value to define the level as a percentage of the maximum speed reference, again subject to a maximum of 500 rpm. The user defined speed reference which defines the speed of the motor should be set to a level higher than the test level, but not high enough for flux weakening to become active. In some cases however, it is possible to perform the test at zero speed provided the motor is free to move, but it may be necessary to increase the test signal from the default value. The test will give the correct results when there is a static load applied to the motor and in the presence of mechanical damping. This test should be used if possible, however for sensorless mode, or if the speed controller cannot be set up for stable operation an alternative test is provided (*Autotune* (00.040) = 4) where a series of torque levels are applied to accelerate and decelerate the motor to measure the inertia.

1. A rotating test is performed in which the motor is accelerated with the currently selected ramps up to the currently selected speed reference, and this speed is maintained for the duration of the test. The *Motor And Load Inertia* (03.018) is set-up.

To perform this autotune test, set Pr **00.040** to 3 and provide the drive with both an enable signal (on terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).

Mechanical load measurement test using applied torque.

Auto-tune test 3 should normally be used for mechanical load measurement, but under some circumstances this test may be used as an alternative. This test will not give such accurate results as test 3 if the motor rated speed is not set to the correct value for the motor. Also this test is likely to give incorrect results if standard ramp mode is active. A series of progressively larger torque levels are applied to the motor (20 %, 40 % ... 100 % of rated torque) to accelerate the motor up to 3/4 x *Rated Speed* (00.045) to determine the inertia from the acceleration/deceleration time. The test attempts to reach the required speed within 5 s, but if this fails the next torque level is used. When 100 % torque is used the test allows 60 s for the required speed to be reached, but if this is unsuccessful, an *Autotune 1* trip is initiated. To reduce the time taken for the test it is possible to define the level of torque to be used for the test by setting *Mechanical Load Test Level* (05.021) to a non-zero value. When the test level is defined the test is only carried out at the defined test level and 60 s is allowed for the motor to reach the required speed. It should be noted that if the maximum speed allows for flux weakening then it may not be possible to achieve the required torque level to accelerate the motor fast enough. If this is the case, the maximum speed reference should be reduced.

- 1. The motor is accelerated in the required direction up to 3/4 of the maximum speed reference and then decelerated to zero speed.
- 2. The test is repeated with progressively higher torques until the required speed is reached.
- 3. Motor And Load Inertia (03.018) and Inertia Times 1000 (04.033) are set up.

To perform this autotune test, set Pr **00.040** to 4 and provide the drive with both an enable signal (on terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702, setting the *Drive Enable* (06.015) to Off (0) or disabling the drive via the control word (Pr **06.042** & Pr **06.043**).

Pr 00.033 {05.016} Rated Speed Optimisation Select

The Rated Frequency (00.047) and Rated Speed (00.045) are used to define the rated slip of the motor. The rated slip is used in sensorless mode (Sensorless Mode Active (03.078) = 1) to correct the motor speed with load. When this mode is active Rated Speed Optimisation Select (00.033) has no effect.

If sensorless mode is not active (*Sensorless Mode Active* (03.078) = 0) the rated slip is used in the motor control algorithm and an incorrect value of slip can have a significant effect on the motor performance. If *Rated Speed Optimisation Select* (00.033) = 0 then the adaptive control system is disabled. However, if *Rated Speed Optimisation Select* (00.033) is set to a non-zero value the drive can automatically adjust the *Rated Speed* (00.045) to give the correct value of rated slip. *Rated Speed* (00.045) is not saved at power-down, and so when the drive is powered-down and up again it will return to the last value saved by the user. The rate of convergence and the accuracy of the adaptive controller reduces at low output frequency and low load. The minimum frequency is defined as a percentage of *Rated Speed Optimisation Minimum Load* (05.020). The adaptive controller is enabled when a motoring or regenerative load rises above *Rated Speed Optimisation Minimum Load* (05.020) + 5%, and is disabled again when it falls below *Rated Speed Optimisation Minimum Load* (05.020). For best optimisation results the correct values of *Stator Resistance* (05.017), *Transient Inductance* (05.024), *Stator Inductance* (05.025), *Saturation Breakpoint 1* (05.029), *Saturation Breakpoint 2* (05.062), *Saturation Breakpoint 3* (05.030) and *Saturation Breakpoint 4* (05.063) should be used.

Pr 00.038 {04.013} / Pr 00.039 {04.014} Current Loop Gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The *Current Controller Kp Gain* (00.038) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by performing a stationary or rotating autotune (see *Autotune* Pr 00.040, earlier in this table) the drive measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor and calculates the current loop gains.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5 % overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed Sensorless RFC-A induction motor applications) the integral gain may need to have a significantly higher value.

8.1.3 RFC-A Sensorless mode

Induction motor without position feedback

Pr 00.046 {05.007} Motor Rated Current

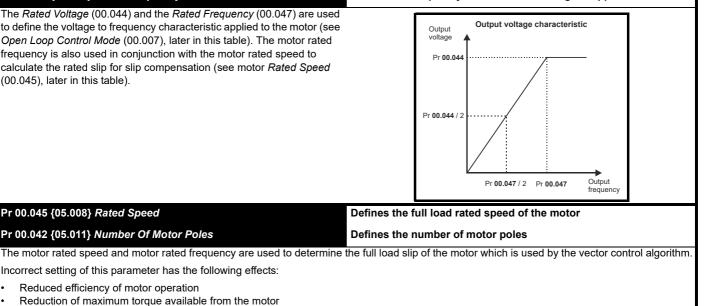

Defines the maximum motor continuous current

The motor rated current parameter must be set to the maximum continuous current of the motor. (See section 8.2 *Maximum motor rated current* on page 108, for information about setting this parameter higher than the maximum Heavy Duty current rating.) The motor rated current is used in the following:

- Current limits (see section 8.3 Current limits on page 108, for more information).
- Motor thermal overload protection (see section 8.4 Motor thermal protection on page 108, for more information)
- Vector control algorithm

Pr 00.044 {05.009} Rated Voltage Pr 00.047 {05.006} Rated Frequency

Defines the voltage applied to the motor at rated frequency Defines the frequency at which rated voltage is applied

- Reduced transient performance
- · Inaccurate control of absolute torque in torque control modes

The nameplate value is normally the value for a hot motor; however, some adjustment may be required when the drive is commissioned if the nameplate value is inaccurate. Either a fixed value can be entered in this parameter or an optimization system may be used to automatically adjust this parameter (see *Rated Speed Optimization Select* (05.016), later in this table).

When Pr **00.042** is set to 'Automatic', the number of motor poles is automatically calculated from the motor *Rated Frequency* (00.047), and the motor *Rated Speed* (00.045).

Number of poles = 120 x (Motor Rated Frequency (00.047 / Motor Rated Speed (00.045) rounded to the nearest even number.

Pr 00.043 {5.010} Rated Power Factor

Defines the angle between the motor voltage and current

The power factor is the true power factor of the motor, i.e. the angle between the motor voltage and current. If the *Stator Inductance* (05.025) is set to zero then the power factor is used in conjunction with the motor *Rated Current* (00.046) and other motor parameters to calculate the rated active and magnetising currents of the motor, which are used in the vector control algorithm. If the stator inductance has a non-zero value this parameter is not used by the drive, but is continuously written with a calculated value of power factor. The stator inductance can be measured by the drive by performing a rotating autotune (see *Autotune* (Pr 00.040), later in this table).

- provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).
- A rotating autotune should only be used if the motor is unloaded. A rotating autotune first performs a stationary autotune, a rotating test is then performed in which the motor is accelerated with currently selected ramps up to a frequency of Rated Frequency (00.047) x 2/3, and the frequency is maintained at the level for up to 40 s. During the rotating autotune the Stator Inductance (05.025), and the motor saturation breakpoints (Pr 05.029, Pr 05.030, Pr 06.062 and Pr 05.063) are modified by the drive. The power factor is also modified for user information only, but is not used after this point as the stator inductance is used in the vector control algorithm instead. To perform a Rotating autotune, set Pr 00.040 to 2, and provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).
- The mechanical load measurement test can measure the total inertia of the load and the motor. This is used to set the speed loop gains (see Speed loop gains) and to provide torque feed-forwards when required during acceleration.

Applied torque (sensorless mode) This test may give inaccurate results, if the motor rated speed is not set to the correct value for the motor, or if standard ramp mode is active. During the mechanical load measurement test a series of progressively larger torque levels are applied to the motor (20 %, 40 % ... 100 % of rated torque) to accelerate the motor up to 3/4 x Rated Speed (00.045) to determine the inertia from the acceleration/deceleration time. The test attempts to reach the required speed within 5 s, but if this fails the next torque level is used. When 100 % torque is used the test allows 60 s for the required speed to be reached, but if this is unsuccessful an Autotune 1 trip is initiated. To reduce the time taken for the test it is possible to define the level of torque to be used for the test by setting Mechanical Load Test Level (05.021) to a non-zero value. When the test level is defined the test is only carried out at the defined test level and 60 s is allowed for the motor to reach the required speed. It should be noted that if the maximum speed allows for flux weakening then it may not be possible to achieve the required torque level to accelerate the motor quickly enough. If this is the case, the maximum speed reference should be reduced. To perform a mechanical load measurement autotune, set Pr 00.040 to 4, and provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).

Following the completion of an autotune test the drive will go into the inhibit state. The drive must be placed into a controlled disable condition before the drive can be made to run at the required reference. The drive can be put in to a controlled disable condition by removing the Safe Torque Off signal from terminal 31, setting the Drive Enable (06.015) to OFF (0) or disabling the drive via the control word (Pr 06.042 & Pr 06.043)

Pr 00.038 {04.013} / Pr 00.039 {04.014} Current Loop Gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The Current Controller Kp Gain (00.038) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by performing a stationary or rotating autotune (see Autotune Pr 00.040, earlier in this table) the drive measures the Stator Resistance (05.017) and Transient Inductance (05.024) of the motor and calculates the current loop gains.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5 % overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed Sensorless RFC-A induction motor applications) the integral gain may need to have a significantly higher value.

					1					-			

Speed Loop Gains (Pr 00.007 {03.010}, Pr 00.008 {03.011}, Pr 00.009 {03.012})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 03.016. If Pr 03.016 = 0, gains Kp1, Ki1 and Kd1 (Pr 00.007 to Pr 00.009) are used, and if Pr 03.016 = 1, gains Kp2, Ki2 and Kd2 (Pr 03.013 to Pr 03.015) are used. Pr 03.016 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 03.017.

Speed Controller Proportional Gain (Kp), Pr 00.007 {03.010} and Pr 03.013

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the stability limit is reached.

Speed Controller Integral Gain (Ki), Pr 00.008 {03.011} and Pr 03.014

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application. For RFC-A Sensorless mode, it is unlikely that the integral gain can be increased much above 0.50.

Differential Gain (Kd), Pr 00.009 {0 3.012} and Pr 03.015

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

There are six methods of tuning the speed loop gains dependant on the setting of Pr **03.017**:

1. Pr 03.017 = 0, User set-up.

This involves the connecting of an oscilloscope to analog output 1 to monitor the speed feedback.

Give the drive a step change in speed reference and monitor the response of the drive on the oscilloscope.

The proportional gain (Kp) should be set up initially. The value should be increased up to the point where the speed overshoots and then reduced slightly.

The integral gain (Ki) should then be increased up to the point where the speed becomes unstable and then reduced slightly.

It may now be possible to increase the proportional gain to a higher value and the process should be repeated until the system response matches the ideal response as shown.

The diagram shows the effect of incorrect P and I gain settings as well as the ideal response.

2. Pr 03.017 = 1, Bandwidth set-up

If bandwidth based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:

- Pr 03.020 Required bandwidth,
- Pr 03.021 Required damping factor,
- Pr 03.018 Motor and load inertia.

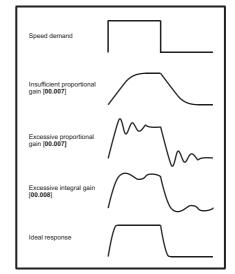

The drive can be made to measure the motor and load inertia by performing a mechanical load measurement autotune (see Autotune Pr **00.040**, earlier in this table).

- 3. Pr 03.017 = 2, Compliance angle set-up
- If compliance angle based set-up is required, the drive can calculate Kp and Ki if the following parameters are set up correctly:
 - Pr 03.019 Required compliance angle,
 - Pr 03.021 Required damping factor,

Pr **03.018** - Motor and load inertia The drive can be made to measure the motor and load inertia by performing a mechanical load measurement autotune (see *Autotune* Pr 00.040, earlier in this table).

4. Pr 03.017 = 3, Kp gains times 16

If *Speed Controller Set-up Method* (03.017) = 3 the selected proportional gain used by the drive is multiplied by 16.

5. Pr **03.017** = 4 - 6

If Speed Controller Set-up Method (03.017) is set to a value from 4 to 6 the Speed Controller Proportional Gain Kp1 (03.010) and Speed Controller Integral Gain Ki1 (03.011) are automatically set up to give the bandwidths given in the table below and a damping factor of unity. These settings give low, standard or high performance.

Pr 03.017	Performance	Bandwidth
4	Low	5 Hz
5	Standard	25 Hz
6	High	100 Hz

6. Pr **03.017** = 7

If Speed Controller Set-up Method (03.017) = 7 then Speed Controller Proportional Gain Kp1 (03.010), Speed Controller Integral Gain Ki1 (03.011) and Speed Controller Differential Feedback Gain Kd1 (03.012) are set up to give a closed-loop speed controller response that approximates to a first order system with a transfer function of 1 / (st + 1), where $\tau = 1/\omega$ bw and ω bw = 2 π x Bandwidth (03.020). In this case the damping factor is

meaningless, and *Damping Factor* (03.021) and *Compliance Angle* (03.019) have no effect.

8.1.4 RFC-S mode

Permanent magnet motor with Position feedback

Pr 00.046 {05.007} Rated Current

Defines the maximum motor continuous current
--

Defines the number of motor poles

The motor rated current parameter must be set to the maximum continuous current of the motor. The motor rated current is used in the following:

Current limits (see section 8.3 Current limits on page 108, for more information)

Motor thermal overload protection (see section 8.4 Motor thermal protection on page 108, for more information)

Pr 00.042 {05.011} Number Of Motor Poles

The number of motor poles parameter defines the number of electrical revolutions in one whole mechanical revolution of the motor. This parameter must be set correctly for the control algorithms to operate correctly. When Pr **00.042** is set to "Automatic" the number of poles is 6.

Pr 00.040 {05.012} Autotune

There are four autotune tests available in RFC-S mode, a stationary autotune, a rotating autotune, mechanical load measurement tests to measure load dependent parameters.

Stationary Autotune

The stationary autotune can be used when the motor is loaded and it is not possible uncouple the load from motor shaft. This test can be used to measure all the necessary parameters for basic control. During the stationary autotune, a test is performed to locate the flux axis of the motor. However this test may not be able to calculate such an accurate value for the *Position Feedback Phase Angle* (00.043) as compared to rotating autotune. A stationary test is performed to measure *Stator Resistance* (05.017), *Ld* (05.024), *Maximum Deadtime Compensation* (05.059), *Current At Maximum Deadtime Compensation* (05.060), *No Load Lq* (05.072). If *Enable Stator Compensation* (05.049) = 1 then *Stator Base Temperature* (05.048) is made equal to *Stator Temperature* (05.046). The *Stator Resistance* (05.017) and the *Ld* (05.024) are then used to set up *Current controller Kp Gain* (00.038) and *Current Controller Ki Gain* (00.039). If sensorless mode is not selected then *Position Feedback Phase Angle* (00.043) is set up for the position from the position feedback interface selected with *Motor Control Feedback Select* (03.026). To perform a Stationary autotune, set Pr **00.040** to 1, and provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).

Rotating Autotune

The rotating autotune must be performed on unloaded motor. This test can be used to measure all the necessary parameters for the basic control and parameters for cancelling the effects of the cogging torque. During the rotating autotune, *Rated Current* (00.046) is applied and the motor is rotated by 2 electrical revolutions (i.e. up to 2 mechanical revolutions)

During the rotating autotune, *Rated Current* (00.046) is applied and the motor is rotated by 2 electrical revolutions (i.e. up to 2 mechanical revolutions) in the required direction. If sensorless mode is not selected then the *Position Feedback Phase Angle* (00.043) is set-up for the position from the position feedback interface selected with *Motor Control Feedback Select* (03.026). A stationary test is then performed to measure *Stator Resistance* (05.017), *Ld* (05.024), *Maximum Deadtime Compensation* (05.059), *Current At Maximum Deadtime Compensation* (05.060) and *No Load Lq* (05.072). *Stator Resistance* (05.017) and *Ld* (05.024) are used to set up *Current Controller Kp Gain* (00.038) and *Current Controller Ki Gain* (00.039). This is only done once during the test, and so the user can make further adjustments to the current controller gains if required. To perform a Rotating autotune, set Pr **00.040** to 2, and provide the drive with both an enable signal (terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702).

Mechanical load measurement test using signal injection

The mechanical load measurement test using signal injection, measures the mechanical characteristic of the motor and load by rotating the motor at the speed defined by the present speed reference and injecting a series of speed test signals. This test should only be used provided all the basic control parameters (including *Torque Per Amp* (05.032)) have been set-up correctly and the speed controller parameters should be set to conservative levels, such as the default values, so that the motor is stable when it runs. The test measures the motor and load inertia, which can be used in automatic set-up of the speed controller gains and in producing a torque feed-forward term. If *Mechanical Load Test Level* (05.021) is left at its default value of zero then the peak level of the injection signal will be 1 % of the maximum speed reference subject to a maximum of 500 rpm. If a different test level is required then *Mechanical Load Test Level* (05.021) should be set to a non-zero value to define the level as a percentage of the maximum speed reference, again subject to a maximum of 500 rpm. The user defined speed reference which defines the speed of the motor should be set to a level higher than the test level, but not high enough for flux weakening to become active. In some cases, however it is possible to perform the test at zero speed provided the motor is free to move, but it may be necessary to increase the test signal from the default value. The test will give the correct results when there is a static load applied to the motor and in the presence of mechanical damping. This test should be used if possible, however for sensorless mode, or if the speed controller cannot be set up for stable operation an alternative test is provided (*Autotune* (00.040) = 4) where a series of torque levels are applied to accelerate and decelerate the motor to measure the inertia.

 A rotating test is performed in which the motor is accelerated with the currently selected ramps up to the currently selected speed reference, and this speed is maintained for the duration of the test. *Motor And Load Inertia* (03.018) and *Inertia Times 1000* (04.033) are set up.
 To perform this autotune test, set Pr 00.040 to 3 and provide the drive with both an enable signal (on terminal 31 on Unidrive M700 / M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700 / M701 and terminal 7 or 8 on Unidrive M702).

Mechanical load measurement using applied torque

Auto-tune test 3 should normally be used for mechanical load measurement, but under some circumstances this test may be used as an alternative. This test is likely to give incorrect results if standard ramp mode is active. A series of progressively larger torque levels are applied to the motor (20 %, 40 % ... 100 % of rated torque) to accelerate the motor up to 3/4 x *Rated Speed* (00.045) to determine the inertia from the acceleration/deceleration time. The test attempts to reach the required speed within 5s, but if this fails the next torque level is used. When 100 % torque is used the test allows 60 s for the required speed to be reached, but if this is unsuccessful, a trip is initiated. To reduce the time taken for the test is defined the test is only carried out at the defined test level and 60 s is allowed for the motor to reached the required speed. It should be noted that if the maximum speed allows for flux weakening then it may not be possible to achieve the required torque level to accelerate the motor fast enough. If this is the case, the maximum speed reference should be reduced.

1. The motor is accelerated in the required direction up to 3/4 of the maximum speed reference and then decelerated to zero speed.

2. The test is repeated with progressively higher torques until the required speed is reached.

3. Motor And Load Inertia (03.018) and Inertia Times 1000 (04.033) are set up. To perform this autotune test, set Pr 00.040 to 4 and provide the drive with both an enable signal (on terminal 31 on Unidrive M700/M701 and terminal 11 & 13 on Unidrive M702) and a run signal (terminal 26 or 27 on Unidrive M700/M701 and terminal 7 or 8 on Unidrive M702).

Pr 00.038 {04.013} / Pr 00.039 {04.014} Current Loop Gains

The current loop gains proportional (Kp) and integral (Ki) gains control the response of the current loop to a change in current (torque) demand. The default values give satisfactory operation with most motors. However, for optimal performance in dynamic applications it may be necessary to change the gains to improve the performance. The proportional gain (Pr 00.038) is the most critical value in controlling the performance. The values for the current loop gains can be calculated by performing a stationary or rotating autotune (see *Autotune* Pr 00.040, earlier in this table) the drive measures the *Stator Resistance* (05.017) and *Transient Inductance* (05.024) of the motor and calculates the current loop gains.

This will give a step response with minimum overshoot after a step change of current reference. The proportional gain can be increased by a factor of 1.5 giving a similar increase in bandwidth; however, this gives a step response with approximately 12.5 % overshoot. The equation for the integral gain gives a conservative value. In some applications where it is necessary for the reference frame used by the drive to dynamically follow the flux very closely (i.e. high speed Sensorless RFC-A induction motor applications) the integral gain may need to have a significantly higher value.

Speed loop gains (Pr 00.007 {03.010}, Pr 00.008 {03.011}, Pr 00.009 {03.012})

The speed loop gains control the response of the speed controller to a change in speed demand. The speed controller includes proportional (Kp) and integral (Ki) feed forward terms, and a differential (Kd) feedback term. The drive holds two sets of these gains and either set may be selected for use by the speed controller with Pr 03.016. If Pr 03.016 = 0, gains Kp1, Ki1 and Kd1 (Pr 00.007 to Pr 00.009) are used, and if Pr 03.016 = 1, gains Kp2, Ki2 and Kd2 (Pr 03.013 to Pr 03.015) are used. Pr 03.016 may be changed when the drive is enabled or disabled. If the load is predominantly a constant inertia and constant torque, the drive can calculate the required Kp and Ki gains to give a required compliance angle or bandwidth dependant on the setting of Pr 03.017.

Speed Controller Proportional Gain (Kp), Pr 00.007 {03.010} and Pr 03.013

If the proportional gain has a value and the integral gain is set to zero the controller will only have a proportional term, and there must be a speed error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual speeds. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the speed error for a given load. If the proportional gain is too high either the acoustic noise produced by speed feedback quantization becomes unacceptable, or the stability limit is reached.

Speed Controller Integral Gain (Ki), Pr 00.008 {03.011} and Pr 03.014

The integral gain is provided to prevent speed regulation. The error is accumulated over a period of time and used to produce the necessary torque demand without any speed error. Increasing the integral gain reduces the time taken for the speed to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application.

Differential Gain (Kd), Pr 00.009 {03.012} and Pr 03.015

The differential gain is provided in the feedback of the speed controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however, for most applications the proportional and integral gains alone are sufficient.

--	-----------------------	------------------------	----------------------------	----------------------------	--------------------	--	----------------------	--------------	---------------------	----------------------------	--	------------------------	-------------	-------------------

8.2 Maximum motor rated current

The maximum motor rated current allowed by the drive is greater than the *Maximum Heavy Duty Current Rating* (00.032). The ratio between the Normal Duty rating and the *Maximum Heavy Duty Current Rating* (00.032) varies between drive sizes. The values for the Normal and Heavy Duty rating can be found in the *Power Installation Guide*. If the motor *Rated Current* (00.046) is set above the *Maximum Heavy Duty Current Rating* (00.032), the current limits and the motor thermal protection scheme are modified (see section 8.3 *Current limits* on page 108 and section 8.4 *Motor thermal protection* on page 108 for more information).

8.3 Current limits

The default setting for the current limit parameters is:

- 165 % (141.9 % for frame 9 and above) x motor rated torque producing current for open loop mode
- 175 % (150 % for frame 9 and above) x motor rated torque producing current for RFC-A and RFC-S modes

There are three parameters which control the current limits:

- · Motoring current limit: power flowing from the drive to the motor
- Regen current limit: power flowing from the motor to the drive
- Symmetrical current limit: current limit for both motoring and regen
 operation

The lowest of either the motoring and regen current limit, or the symmetrical current limit applies.

The maximum setting of these parameters depends on the values of motor rated current, drive rated current and the power factor.

Increasing the motor rated current (Pr **00.046/05.007**) above the Heavy Duty rating (default value), will automatically reduce the current limits in Pr **04.005** to Pr **04.007**. If the motor rated current is then set to or below the Heavy Duty rating, the current limits will be left at their reduced values.

The drive can be oversized to permit a higher current limit setting to provide higher accelerating torque as required up to a maximum of 1000 %.

8.4 Motor thermal protection

A dual time constant thermal model is provided to estimate the motor temperature as a percentage of its maximum allowed temperature.

The motor thermal protection is modelled using losses in the motor. The losses in the motor are calculated as a percentage value, so that under these conditions the *Motor Protection Accumulator* (04.019) would eventually reach 100 %.

Percentage losses = 100 % x [Load related losses + Iron losses] Where:

Load related losses = $(1 - K_{fe}) \times [(I / (K_1 \times I_{Rated}))]^2$

Iron losses = $K_{fe} \times (w / w_{Rated})^{1.6}$

Where:

I = Current Magnitude (00.012)

I_{Rated} = *Rated Current* (00.046)

 K_{fe} = Rated Iron Losses As Percentage Of Losses (04.039) / 100 %

The Motor Protection Accumulator (04.019) is given by:

Pr **04.019** = Percentage Losses x [(1 - K_2) (1 - $e^{-t/\tau 1}$) + K_2 (1 - $e^{-t/\tau 2}$)] Where:

T = Motor Protection Accumulator (04.019)

 ${\rm K_2}$ = Motor Thermal Time Constant 2 Scaling (04.038) / 100 %

 τ^1 = Motor Thermal Time Constant 1 (00.053)

```
\tau^2 = Motor Thermal Time Constant 2 (04.037)
```

K₁ = Varies, see below

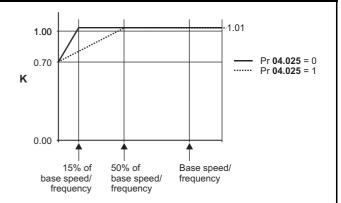

If Rated Current (00.046) ≤ Maximum Heavy Duty Current (00.032)

Figure 8-1 Motor thermal protection (Heavy Duty)

If Pr **04.025** is 0 the characteristic is for a motor which can operate at rated current over the whole speed range. Induction motors with this type of characteristic normally have forced cooling. If Pr **04.025** is 1 the characteristic is intended for motors where the cooling effect of motor fan reduces with reduced motor speed below 50 % of base speed/ frequency. The maximum value for K1 is 1.05, so that above the knee of the characteristics the motor can operate continuously up to 105 % current.

Both settings of Pr **04.025** are intended for motors where the cooling effect of the motor fan reduces with reduced motor speed, but with different speeds below which the cooling effect is reduced. If Pr **04.025** is 0 the characteristic is intended for motors where the cooling effect reduces with motor speed below 15 % of base speed/frequency. If Pr **04.025** is 1 the characteristic is intended for motors where the cooling effect reduces with motor speed below 50 % of base speed/frequency. The maximum value for K1 is 1.01, so that above the knee of the characteristics the motor can operate continuously up to 101 % current.

When the estimated temperature in Pr **04.019** reaches 100 % the drive takes some action depending on the setting of Pr **04.016**. If Pr **04.016** is 0, the drive trips when Pr **04.019** reaches 100 %. If Pr **04.016** is 1, the current limit is reduced to (K - 0.05) x 100 % when Pr **04.019** reaches 100 %.

The current limit is set back to the user defined level when Pr **04.019** falls below 95 %. The thermal model temperature accumulator accumulates the temperature of the motor while the drive remains powered-up. By default, the accumulator is set to the power down value at power-up. If the rated current defined by Pr **00.046** is altered, the accumulator is reset to zero.

The default setting of the thermal time constant (Pr 00.053) is 89 s which is equivalent to an overload of 150 % for 60 s from cold.

8.5 Switching frequency

The default switching frequency is 3 kHz (6 kHz in RFC-S mode), however this can be increased up to a maximum of 16 kHz by Pr **00.041** (dependent on drive size). The available switching frequencies are shown below.

Table 8-1	Available switching	frequencies
	Aranabic Suitering	nequeneres

Drive size	Model	2 kHz	3 kHz	4 kHz	6 kHz	8 kHz	12 kHz	16 kHz
3								
4								
5								
6	All	✓	✓	✓	\checkmark	~	✓	✓
7								
8								
9E								
	10202830 to 10203000			✓	V		~	
10	10501520 to 10501900	~	~			~		~
10	10601500 to 10601780							
	10402700 to 10403200	~	~	~	~			
11	400 V	~	~	~	~	~		
11	575 and 690 V	~	~	~				

If switching frequency is increased from 3 kHz the following apply:

- Increased heat loss in the drive, which means that derating to the output current must be applied. See the derating tables for switching frequency and ambient temperature in the *Power Installation Guide*.
- 2. Reduced heating of the motor due to improved output waveform quality.
- 3. Reduced acoustic noise generated by the motor.
- 4. Increased sample rate on the speed and current controllers. A trade off must be made between motor heating, drive heating and the demands of the application with respect to the sample time required.

Table 8-1 Sample rates for various control tasks at each switching frequency

Background				critical user rface	

8.6 High speed operation

8.6.1 Encoder feedback limits

The maximum encoder frequency should be prevented from exceeding 500 kHz. In RFC-A and RFC-S modes the maximum speed that can be entered in to the speed reference clamps (Pr **00.002** and Pr **00.001**) can be limited by the drive. This is defined by the following (subject to an absolute maximum of 33,000 rpm):

Maximum speed limit (rpm) =
$$\frac{500 \text{ kHz x } 60}{\text{ELPR}}$$

= $\frac{3.0 \text{ x } 10^7}{\text{ELPR}}$

Where:

ELPR is the equivalent encoder lines per revolution and is the number of lines that would be produced by a quadrature encoder.

- Quadrature encoder ELPR = number of lines per revolution
- F and D encoder ELPR = number of lines per revolution / 2
- SINCOS encoder ELPR = number of sine waves per revolution

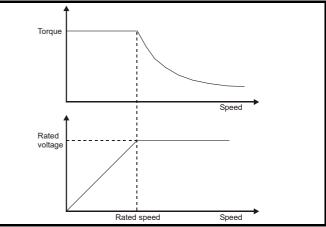

This maximum speed limit is defined by the device selected with the speed feedback selector (Pr 03.026), and the ELPR set for the position feedback device. In RFC-A mode it is possible to disable this limit via Pr 03.024, so that the drive can be switched between operation with and without feedback when the speed becomes too high for the feedback device.

8.6.2 Field weakening (constant power) operation

(Open loop and RFC-A mode only)

The drive can be used to run an induction machine above synchronous speed into the constant power region. The speed continues to increase and the available shaft torque reduces. The characteristics below show the torque and output voltage characteristics as the speed is increased above the rated value.

Care must be taken to ensure the torque available above base speed is sufficient for the application to run satisfactorily. The saturation breakpoint parameters (Pr **05.029**, Pr **05.030**, Pr **05.062** and Pr **05.063**) found during the autotune in RFC-A mode ensure the magnetizing current is reduced in the correct proportion for the specific motor. (In open loop mode the magnetizing current is not actively controlled).

8.6.3 Permanent magnet motor high speed operation

High speed servo mode is enabled by setting Pr **05.022** =1. Care must be taken when using this mode with permanent magnet motor to avoid damaging the drive. The voltage produced by the permanent magnet motor magnets is proportional to speed. For high speed operation the drive must apply currents to the motor to counter-act the flux produced by the magnets. It is possible to operate the motor at very high speeds

Safety information Product information Mechanical installation Electrical installation Getting started Basic parameters Running the motor Drive communication NV Media Card Operation Onboard PLC Advanced parameters Diagnostics UL information
--

that would give a very high motor terminal voltage, but this voltage is prevented by the action of the drive.

If however, the drive is disabled (or tripped) when the motor voltages would be higher than the rating of the drive without the currents to counter-act the flux from the magnets, it is possible to damage the drive. If high speed mode is enabled the motor speed must be limited to the levels given in the table below unless an additional hardware protection system is used to limit the voltages applied to the drive output terminals to a safe level.

Drive voltage rating	Maximum motor speed (rpm)	Maximum safe line to line voltage at the motor terminals (V rms)
200	400 x 1000 / (Ke x √2)	400 / √2
400	800 x 1000 / (Ke x √2)	800 / √2
575	955 x 1000 / (Ke x √2)	955 / √2
690	1145 x 1000 / (Ke x √2)	1145 / √2

Ke is the ratio between r.m.s. line to line voltage produced by the motor and the speed in V/1000 rpm. Care must also be taken not to demagnetize the motor. The motor manufacturer should always be consulted before using this mode.

By default, high speed operation is disabled (Pr 05.022 = 0).

It is also possible to enable high speed operation and allow the drive to automatically limit the motor speed to the levels specified in the table and generate an *Overspeed.1* trip if the level is exceeded (Pr **05.022** = -1).

8.6.4 Switching frequency

With a default switching frequency of 3 kHz the maximum output frequency should be limited to 250 Hz. Ideally a minimum ratio of 12:1 should be maintained between the switching frequency and the output frequency. This ensures the number of switchings per cycle is sufficient to ensure the output waveform quality is maintained at a minimum level. If this is not possible, quasi-square switching should be enabled (Pr **05.020** =1). The output waveform will be quasi square above base speed ensuring a symmetrical output waveform, which results in a better quality output than would otherwise result.

8.6.5 Maximum speed / frequency

In all operating modes (Open loop, RFC-A and RFC-S) the maximum output frequency is limited to 550 Hz. However, in RFC-S mode the speed is also limited by the voltage constant (Ke) of the motor. Ke is a specific constant for the servo motor being used. It can normally be found on the motor data sheet in V/k rpm (volts per 1,000 rpm).

8.6.6 Quasi-Square wave (open-loop only)

The maximum output voltage level of the drive is normally limited to an equivalent of the drive input voltage minus voltage drops within the drive (the drive will also retain a few percent of the voltage in order to maintain current control). If the motor rated voltage is set at the same level as the supply voltage, some pulse deletion will occur as the drive output voltage approaches the rated voltage level. If Pr **05.020** (Quasi-square wave enable) is set to 1 the modulator will allow over modulation, so that as the output frequency increases beyond the rated frequency the voltage continues to increase above the rated voltage. The modulation depth will increase beyond unity; first producing trapezoidal and then quasi-square waveforms.

This can be used for example:

- To obtain high output frequencies with a low switching frequency which would not be possible with space vector modulation limited to unity modulation depth,
- or
- In order to maintain a higher output voltage with a low supply voltage.

The disadvantage is that the machine current will be distorted as the modulation depth increases above unity, and will contain a significant amount of low order odd harmonics of the fundamental output frequency.

The additional low order harmonics cause increased losses and heating in the motor.

9 Drive communication

This section details the communication protocols supported on the drives.

The drive is supplied with either an Ethernet interface (Unidrive M700 / M702), or an EIA 485 serial communication interface (Unidrive M701).

For more information on the parameters associated with each interface and the connection details please refer to section 5.12 *Communications* on page 46.

9.1 CT Modbus RTU specification (Unidrive M701)

This section describes the adaptation of the MODBUS RTU protocol offered on Control Techniques' products. The portable software class which implements this protocol is also defined.

MODBUS RTU is a master slave system with half-duplex message exchange. The Control Techniques (CT) implementation supports the core function codes to read and write registers. A scheme to map between MODBUS registers and CT parameters is defined. The CT implementation also defines a 32 bit extension to the standard 16 bit register data format.

9.1.1 MODBUS RTU

Physical layer

Attribute	Description
Normal physical layer for multi-drop operation	EIA 485 2 wire
Bit stream	Standard UART asynchronous symbols with Non Return to Zero (NRZ)
Symbol	Each symbol consists of:- 1 start bit 8 data bits (transmitted least significant bit first) 2 stop bits*
Baud rates	300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 76800, 115200

* The drive will accept a packet with 1 or 2 stop bits but will always transmit 2 stop bits

RTU framing

The frame has the following basic format

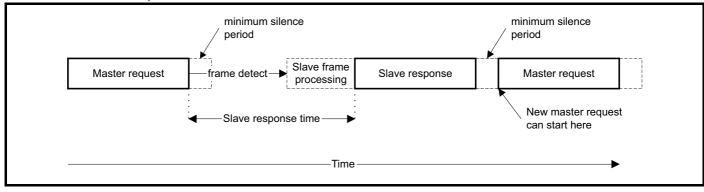

SLAVE ADDRESS	FUNCTION CODE	message data	16bit CRC	Silent interval
		Message data		

The frame is terminated with a minimum silent period of 3.5 character times (for example, at 19200 baud the minimum silent period is 2 ms). Nodes use the terminating silence period to detect the end of frame and begin frame processing. All frames must therefore be transmitted as a continuous stream without any gaps greater or equal to the silence period. If an erroneous gap is inserted then receiving nodes may start frame processing early in which case the CRC will fail and the frame will be discarded.

MODBUS RTU is a master slave system. All master requests, except broadcast requests, will lead to a response from an individual slave. The slave will respond (i.e. start transmitting the response) within the quoted maximum slave response time (this time is quoted in the data sheet for all Nidec Industrial Automation's products). The minimum slave response time is also quoted but will never be less that the minimum silent period defined by 3.5 character times.

If the master request was a broadcast request then the master may transmit a new request once the maximum slave response time has expired.

The master must implement a message time out to handle transmission errors. This time out period must be set to the maximum slave response time + transmission time for the response.

1	Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	Drive	NV Media Card	Onboard	Advanced	Diagnostics	UL
	information	information	installation	installation	started	parameters	the motor	Optimization	communication	Operation	PLC	parameters	Diagnostics	information

9.1.2 Slave address

The first byte of the frame is the slave node address. Valid slave node addresses are 1 through 247 decimal. In the master request this byte indicates the target slave node; in the slave response this byte indicates the address of the slave sending the response.

Global addressing

Address zero addresses all slave nodes on the network. Slave nodes suppress the response messages for broadcast requests.

9.1.3 MODBUS registers

The MODBUS register address range is 16 bit (65536 registers) which at the protocol level is represented by indexes 0 through 65535.

PLC registers

Modicon PLCs typically define 4 register 'files' each containing 65536 registers. Traditionally, the registers are referenced 1 through 65536 rather than 0 through 65535. The register address is therefore decremented on the master device before passing to the protocol.

File type	Description
1	Read only bits ("coil")
2	Read / write bits ("coil")
3	Read only 16bit register
4	Read / write 16bit register

The register file type code is NOT transmitted by MODBUS and all register files can be considered to map onto a single register address space. However, specific function codes are defined in MODBUS to support access to the "coil" registers.

All standard drive parameters are mapped to register file '4' and the coil function codes are not required.

CT parameter mapping

The Modbus register address is 16 bits in size, of which the upper two bits are used for data type selection leaving 14 bits to represent the parameter address, taking into account the slave increments the address value by 1, this results in a theoretical maximum parameter address of 163.84 (limited to 162.99 in software) when the default standard addressing mode (see *Serial Mode* (11.024)) is used.

To access a parameter number above 99 in any drive menu then the modified addressing mode must be used (see *Serial Mode* (11.024)), this will allow access to parameter numbers up to 255 but also limit the maximum menu number to 63.

The Modbus slave device increments the register address by 1 before processing the command, this effectively prevents access to parameter Pr **00.000** in the drive or option module.

The table below shows how the start register address is calculated for both addressing modes.

Parameter	Addressing mode		Protocol	register				
0.mm.ppp	Standard	mm x 100 + ppp - 1						
0.1111.ррр	Modified		mm x 256 + ppp - 1					
		Examples						
		16-b	it	32-bit				
		Decimal	Hex (0x)	Decimal	Hex (0x)			
0.01.021	Standard	120	00 78	16504	40 78			
0.01.021	Modified	276	01 14	16660	41 14			
0.01.000	Standard	99	00 63	16483	40 63			
0.01.000	Modified	255	00 FF	16639	40 FF			
0.03.161	Standard	N/A	N/A	N/A	N/A			
0.03.101	Modified	928	03 A0	17312	43 A0			

Data types

The MODBUS protocol specification defines registers as 16 bit signed integers. All CT devices support this data size.

Refer to the section 9.1.7 Extended data types on page 114 for detail on accessing 32 bit register data.

9.1.4 Data consistency

All CT devices support a minimum data consistency of one parameter (16 bit or 32 bit data). Some devices support consistency for a complete multiple register transaction.

9.1.5 Data encoding

MODBUS RTU uses a 'big-endian' representation for addresses and data items (except the CRC, which is 'little-endian'). This means that when a numerical quantity larger than a single byte is transmitted, the MOST significant byte is sent first. So for example

16 - bits	0x1234	would be	0x12	0x34		
32 - bits	0x12345678	would be	0x12	0x34	0x56	0x78

9.1.6 Function codes

The function code determines the context and format of the message data. Bit 7 of the function code is used in the slave response to indicate an exception.

Safety information Product information Mechanical installation Electrical installation Getting started Basic parameters Running the motor Optimization Drive communication NV Media Card Onboard Advanced parameters Diagno	ignostics UL information
--	--------------------------

The following function codes are supported:

Code	Description
3	Read multiple 16 bit registers
6	Write single register
16	Write multiple 16 bit registers
23	Read and write multiple 16 bit registers

FC03 Read multiple

Read a contiguous array of registers. The slave imposes an upper limit on the number of registers, which can be read. If this is exceeded the slave will issue an exception code 2.

Table 9-1 Master request

9.1.7 Extended data types

Standard MODBUS registers are 16bit and the standard mapping maps a single #X.Y parameter to a single MODBUS register. To support 32 bit data types (integer and float) the MODBUS multiple read and write services are used to transfer a contiguous array of 16bit registers.

Slave devices typically contain a mixed set of 16 bit and 32 bit registers. To permit the master to select the desired 16 bit or 32 bit access the top two bits of the register address are used to indicate the selected data type.

NOTE

The selection is applied for the whole block access.

bit 15 TYP1	bit 14 TYP0	bits 0 - 13
Type s	select	Parameter address X x 100+Y-1

The 2 bit type field selects the data type according to the table below:

Type field bits 15-14	Selected data type	Comments
00	INT16	backward compatible
01	INT32	
10	Float32	IEEE754 standard Not supported on all slaves
11	Reserved	

If a 32 bit data type is selected then the slave uses two consecutive 16 bit MODBUS registers (in 'big endian'). The master must also set the correct 'number of 16 bit registers'.

Example, read Pr **20.021** through Pr **20.024** as 32 bit parameters using FC03 from node 8:

Table 9-9 Master request

Byte	Value	Description
0	0x08	Slave destination node address
1	0x03	FC03 multiple read
2	0x47	Start register address Pr 20.021
3	0xE4	(16384 + 2021 - 1) = 18404 = 0x47E4
4	0x00	Number of 16bit registers to read
5	0x08	Pr 20.021 through Pr 20.024 is 4x32 bit registers = 8x16 bit registers
6	CRC LSB	
7	CRC MSB	

Table 9-10 Slave response

Byte	Value	Description
0	0x08	Slave destination node address
1	0x03	FC03 multiple read
2	0x10	Length of data (bytes) = 4x32 bit registers = 16 bytes
3-6		Pr 20.021 data
7-10		Pr 20.022 data
11-14		Pr 20.023 data
15-18		Pr 20.024 data
19	CRC LSB	
20	CRC MSB	

Reads when actual parameter type is different from selected The slave will send the least significant word of a 32 bit parameter if that parameter is read as part of a 16 bit access.

The slave will sign extend the least significant word if a 16 bit parameter is accessed as a 32 bit parameter. The number of 16 bit registers must be even during a 32 bit access.

Example, If Pr **01.028** is a 32 bit parameter with a value of 0x12345678, Pr **01.029** is a signed 16 bit parameter with a value of 0xABCD, and Pr **01.030** is a signed 16 bit parameter with a value of 0x0123.

Read	Start register address	Number of 16 bit registers	Response	Comments
Pr 01.028	127	1	0x5678	Standard 16 bit access to a 32 bit register will return low 16 bit word of truncated data
Pr 01.028	16511*	2	0x12345678	Full 32 bit access
Pr 01.028	16511*	1	Exception 2	Number of words must be even for 32 bit access
Pr 01.029	128	1	0xABCD	Standard 16 bit access to a 32 bit register will return low 16 bit word of data
Pr 01.029	16512*	2	0xFFFFABCD	32 bit access to a 16 bit register will return 32 bit sign extended data
Pr 01.030	16513*	2	0x00000123	32 bit access to a 16 bit register will return 32 bit sign extended data
Pr 01.028 to Pr 01.029	127	2	0x5678, 0xABCD	Standard 16 bit access to a 32 bit register will return low 16 bit word of truncated data
Pr 01.028 to Pr 01.029	16511*	4	0x12345678, 0xFFFFABCD	Full 32 bit access

* Bit 14 is set to allow 32 bit access.

Writes when actual parameter type is different from selected

The slave will allow writing a 32 bit value to a 16 bit parameter as long as the 32 bit value is within the normal range of the 16 bit parameter.

The slave will allow a 16 bit write to a 32 bit parameter. The slave will sign extend the written value, therefore the effective range of this type of write will be -32768 to +32767.

	ſ	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
--	---	-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	-------------------	--------------	---------------------	----------------------------	----------------	------------------------	-------------	-------------------

Examples, if Pr 01.028 has a range of ±100000, and Pr 01.029 has a range of ±10000.

Write	Start register address	Number of 16bit registers	Data	Comments
Pr 01.028	127	1	0x1234	Standard 16 bit write to a 32bit register. Value written = 0x00001234
Pr 01.028	127	1	0xABCD	Standard 16 bit write to a 32bit register. Value written = 0xFFFFABCD
Pr 01.028	16511	2	0x00001234	Value written = 0x00001234
Pr 01.029	128	1	0x0123	Value written = 0x0123
Pr 01.029	16512	2	0x00000123	Value written = 0x00000123

* Bit 14 is set to allow 32 bit access

9.1.8 Exceptions

The slave will respond with an exception response if an error is detected in the master request. If a message is corrupted and the frame is not received or the CRC fails then the slave will not issue an exception. In this case the master device will time out. If a write multiple (FC16 or FC23) request exceeds the slave maximum buffer size then the slave will discard the message. No exception will be transmitted in this case and the master will time out.

Exception message format

The slave exception message has the following format.

Byte	Description
0	Slave source node address
1	Original function code with bit 7 set
2	Exception code
3	CRC LSB
4	CRC MSB

Exception codes

The following exception codes are supported.

Code	Description
1	Function code not supported
2	Register address out of range, or request to read too many registers

Parameter over range during block write FC16

The slave processes the write block in the order the data is received. If a write fails due to an out of range value then the write block is terminated. However, the slave does not raise an exception response, rather the error condition is signalled to the master by the number of successful writes field in the response.

Parameter over range during block read/write FC23

There will be no indication that there has been a value out of range during a FC23 access.

9.1.9 CRC

The CRC is a 16 bit cyclic redundancy check using the standard CRC-16 polynomial x16 + x15 + x2 + 1. The 16 bit CRC is appended to the message and transmitted LSB first.

The CRC is calculated on ALL the bytes in the frame.

9.1.10 Device compatibility parameters

All devices have the following compatibility parameters defined:

Parameter	Description
Device ID	Unique device identification code
Minimum slave response time	The minimum delay between the end of a message from the master and the time at which the master is ready to receive a response from the slave. Refer to Pr 11.029 (<i>Minimum Comms Transmit Delay</i>).
Maximum slave response time	When global addressing, the master must wait for this time before issuing a new message. In a network of devices, the slowest time must be used.
Maximum baud rate	
32 bit float data type supported	If this data type is not supported then an over range error will be raised if this data type is used.
Maximum buffer size	Determines the maximum block size.

9.2 Ethernet communication (Unidrive M700 / M702)

This section describes the adaptation of the Ethernet interface offered on the Unidrive M700 and M702 drives. The portable software class which implements this protocol is also defined.

9.2.1 Features

The following list gives an overview of the functionality available:

- Dual RJ45 connectivity with support for shielded twisted pair.
- 100 Mbs Ethernet with auto-negotiation.
- Full and half duplex operation with auto-negotiation.
- Auto crossover detection.
- TCP/IP.
- Modbus TCP/IP.
- EtherNet/IP or Profinet IO.
- Switch or Gateway mode.
- VLAN tagging.
- SyPTPro.
- Unidrive M Connect.
- Machine Control Studio.
- Static IP configuration or DHCP client.
- Non-cyclic data transfer with user program.
- Up to 3 transmit and 3 receive cyclic links (easy mode).
- IEEE1588 Precision Time Protocol synchronization.
- RTMoE (Real Time Motion over Ethernet).

9.2.2 Backup/auxiliary supply

Some drives provide a method of powering up the control circuits (and therefore any option module installed) if the AC supply is removed, this allows Ethernet communication to continue operating when the main AC supply is switched off.

9.2.3 Network design considerations

Ethernet is an open system allowing many different vendors to design and supply equipment. When designing an industrial network you must carefully consider the topology and data traffic on the network to avoid potential problems.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	Drive	NV Media Card	Onboard	Advanced	Diagnostics	UL
information	information	installation	installation	started	parameters	the motor	Optimization	communication	Operation	PLC	parameters	Diagnostics	information

To avoid bandwidth issues it is recommended that the control network is logically separate from any other network. Where possible a physically separate network should be used. If this is not possible, the use of managed network devices should be considered to prevent unnecessary traffic such as broadcasts reaching the control network.

NOTE The use of un-switched hubs is not supported.

9.2.4 Addressing

The addressing system used on Ethernet uses two essential numbers for making connection, these are the IP address and the subnet mask. The address allows a specific device to be located and the subnet mask defines how many bits represent the subnet part of the address and how many bits represent the node address (*see section 9.2.7 Generating the complete address* on page 116). Generally devices on different subnets can only communicate by using a gateway (*typically a router or firewall*).

9.2.5 Where do IP addresses come from?

Every address on a network must be unique. If you do not connect your network to any other networks the assignment of IP addresses is not critical (*although using a standard system is recommended*), as you have full control of the addresses used. The issue of addressing becomes important when connecting multiple networks together or connecting to the Internet where there is a strong possibility of duplication of addresses if a scheme is not followed.

9.2.6 Addressing etiquette

The following list details some points that should be considered when selecting addresses:

- Reserve address space: Ensure you have enough reserve address space on your chosen addressing scheme to allow for future expansion.
- Uniqueness: Ensure your addresses are unique, every device on a subnet must have a unique address.
- Avoid reserved addresses: For example the address 127.0.0.1 is reserved as the loop back address.
- Broadcast and system addresses: The highest and lowest host address on a subnet are reserved addresses.
- Use a system: Have a scheme for assigning your addresses, for example typically servers may have a low IP address and routers a high IP address. It is not necessary to allocate consecutive IP addresses so it is possible to reserve ranges for specific uses such as servers, work stations or routers.

9.2.7 Generating the complete address

A complete IP address consists of an IP address and a subnet mask, these two numbers are required to allow communication on Ethernet using TCP/IP.

The IP address

The IP address is made up from four 8 bit decimal numbers (*octets*) and is written as follows:

w.x.y.z for example 192.168.0.1

The subnet mask

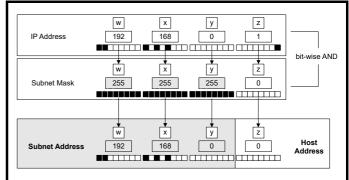

The subnet mask defines what part of the address constitutes the subnet within the IP address and what part of the address constitutes the host address. The subnet mask is bit-wise ANDed with the address to give the subnet to which the host belongs. A typical subnet mask would be 255.255.255.0, this may alternatively be written as '/24' as in the example below, showing an IP address of 192.168.0.1 with a subnet mask of 255.255.255.0. This alternative notation indicates the number of bits representing the subnet part of the address, starting from the most significant bit.

Alternative subnet mask notation: 192.168.0.1/24

Completing the address

To determine which part of the address constitutes the network address and which part constitutes the node address, the IP address is bit-wise ANDed with the subnet mask. Figure 9-1 shows how the IP address and subnet mask are used to determine the subnet address and the host address.

Figure 9-1 Completing the address

9.2.8 DHCP considerations Using fixed IP addressing

Using fixed IP addresses (*manually configured*) means that if a module fails, the IP address can be restored to a replacement module without the need to reconfigure the DHCP server. Using fixed addresses also prevents the DHCP server from changing the address. When using fixed IP addresses, it is vital that the IP address is reserved on the DHCP server to prevent duplicate addressing.

NOTE If using manual IP address configuration please note that the IP address subnet mask and the default gateway must also be set manually.

NOTE In Profinet mode, Pr **4.02.004** (*DHCP Enable*) will be forced off on initialisation.

9.2.9 Basic principles of routing

Routing is required to get TCP/IP packets from one subnet to another. In an IP network, nodes from one subnet cannot communicate directly with nodes on a different subnet. To allow nodes to communicate, a router (*or similar device*) is required to allow the two subnets to exchange data. This means that any node wishing to communicate with a node that is not on its own subnet, must know the address of a router that is on its own subnet. This is sometimes called a gateway or default gateway.

9.3 CT Modbus TCP/IP specification (Unidrive M700 / M702)

Modbus TCP/IP

Modbus TCP/IP is one of the most widely supported industrial Ethernet based protocols offering the functionality and simplicity of the Modbus protocol, with the flexibility of Ethernet. Table 9-11 shows the supported Modbus function codes.

Modbus TCP/IP uses the standard Modbus RTU Protocol Data Unit (PDU) but without the CRC bytes and encapsulates it within a Modbus TCP/IP Application Data Unit (ADU) for transmission. This means that the Modbus PDU is the same for both standard (RTU) and Ethernet based transmission.

Table 9-11 Supported Modbus function

Code	Description
3	Read multiple 16 bit registers.
6	Write single 16 bit register.
16	Write multiple 16 bit registers.
23	Read and write multiple 16 bit registers.

	1	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
--	---	-----------------------	------------------------	----------------------------	----------------------------	-----------------	---------------------	----------------------	--------------	------------------------	----------------------------	----------------	------------------------	-------------	-------------------

9.3.1 Data structure

Communication between devices is based upon Modbus Application Data Units (ADUs), the ADU consists of 2 parts, the Modbus Application Protocol (MBAP) header and the Modbus Protocol Data Unit (PDU).

Figure 9-2 Modbus Data Structure

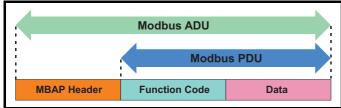

Table 9-12 MBAP Header

Field	Length (Bytes)	Description
Transaction Identifier	2	Uniquely identifies the transaction (0 to 65535)
Protocol Identifier	2	Identifies the protocol (0 = Modbus)
Length	2	Number of following bytes in the message
Unit Identifier	1	Uniquely identifies the destination node (0 to 255)

The unit identifier within the MBAP header is used to identify whether the destination node is the host drive or an option module (not available on the onboard Ethernet interface with firmware versions prior to V01.02.01.10).

Table 9-13 MBAP Unit Identifier

Unit Identifier	Destination
0 or 255	Drive
1	Slot 1
2	Slot 2
3	Slot 3
4	Slot 4 (onboard Ethernet)
254	Self

9.3.2 Data access

Data access using Modbus TCP/IP takes the form of a request for data by the master, followed by a response from the slave indicating success or failure. If no response is received this indicates that the message has not been received or the message is invalid or the node is unable to reply.

Each drive or option module parameter is internally mapped to a single 16-bit Modbus register, all Modbus function codes access 16-bit registers only. To access a 32-bit parameter, two contiguous Modbus registers must be specified in the request and the 32-bit data access scheme must be used.

9.3.3 32-bit data access

Standard Modbus registers are 16 bits in size and reference a single drive/option module parameter. To access a 32-bit data value the multiple read/write services must be used to transfer a contiguous array of 16-bit registers. To instruct the client to select either 16-bit or 32-bit access bit 14 of the register address is used.

NOTE Bit b15 of the register address is reserved for future use.

Figure 9-3 Data type selection

bit 14		bit 13 to 0
pe	F	legister address
14	Data type	1
)	16-bit	
1	32-bit]
	pe	pe R 14 Data type 0 16-bit

If 32-bit data type is selected then this effectively adds 16384 (0x4000) to the start register address.

e.g. For drive parameter Pr 01.021 in standard addressing mode, the start register value is 16384 + 120 = 16504 (0x4078)

9.3.4 Supported Modbus function codes

The following table details the supported Modbus function codes.

Table 9-14 Supported Modbus function codes

Function Code		Description
Decimal	Hex (0x)	Description
3	03	Read multiple 16-bit registers
6	06	Write single 16-bit register
16	10	Write multiple 16-bit registers
23	17	Read and write multiple 16-bit registers

Register addressing 9.3.5

The Modbus register address is 16 bits in size, of which the upper two bits are used for data type selection leaving 14 bits to represent the parameter address, taking into account the slave increments the address value by 1, this results in a theoretical maximum parameter address of 163.84 (limited to 162.99 in software) when the default standard addressing mode (see Modbus Register Addressing Mode (S.15.013)) is used.

To access a parameter number above 99 then the modified addressing mode must be used (see Modbus Register Addressing Mode (S.15.013)), this will allow access to parameter numbers up to 255 but also limit the maximum menu number to 63.

NOTE A reset is not required to activate the change, the addressing mode is effectively made active immediately on changing.

The Modbus slave device increments the register address by 1 before processing the command, this effectively prevents access to parameter Pr 00.000 in the drive or option module.

The Table 9-15 shows how the start register address is calculated for both addressing modes.

information installation started parameters are motor epolation recommended in motion	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information

0.03.101	Modified	928	03 A0	17312	43 A0

9.3.6 FC03 – Read multiple registers

This function code allows a contiguous array of registers to be read. The maximum number of registers that can be read is 120, this allows up to 120 16-bit parameters or 60 32-bit parameters to be read in a single transaction. If this is exceeded the server will issue an exception response code 2.

Master request data

Byte	Description
7	Function code 0x03
8	Start register address (MSB)
9	Start register address (LSB)
10	Number of 16-bit registers (MSB)
11	Number of 16-bit registers (LSB)

Slave response data	lave	response	data
---------------------	------	----------	------

Byte	Description
7	Function code 0x03
8	Length of data in read block (Bytes)
9	Register data (MSB)
10	Register data (LSB)

The normal response includes the function code, number of data bytes in the read block followed by the register data (unless an exception occurs).

If 32-bit parameter addressing is used, then for each parameter read:

- · Two 16-bit registers must be used in the request
- The register data in the response will contain 4 bytes of data **Example**

To read drive parameters **0.20.021** to **0.20.023** (transaction ID = 42) with 32-bit data access and standard addressing:

9.3.7 FC06 – Write single register

This function code writes a single 16-bit value to a register. The normal response is an echo of the request (unless an exception occurs) returned after the parameter has been written.

The register address can be a 32-bit parameter address but only the lower 16 bits of the value will be written.

9.3.8 FC16 – Write multiple registers

This function code allows a contiguous series of registers to be written. The maximum number of registers that can be written is 120, this allows up to 120 16-bit parameters or 60 32-bit parameters to be read in a single transaction. If this is exceeded the server will issue an exception response code 2.The normal response includes the function code, start register address and number of 16-bit registers written (unless an exception occurs), returned after the parameters have been written.

Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
					-						-		

If 32-bit parameter addressing is used, then for each parameter written:

- Two 16-bit registers must be used in the request
- Four bytes must be specified in the request
- The number of registers written in the response will be twice the number of parameters written

9	Register data (MSB)
10	Register data (LSB)

The normal response includes the function code, number of data bytes in the read block followed by the register data (unless an exception occurs).

If 32-bit parameter addressing is used:

- For each parameter read or written, two 16-bit registers must be used in the request
- For each parameter written, four bytes must be specified in the request
- For each parameter read, four bytes of data will be used in the response

9.3.9 FC23 - Read/Write multiple registers

This function code allows a contiguous series of registers to be written and another contiguous series of registers to be read. The maximum number of registers that can be read is 120 and similarly the maximum number of registers that can be written is 120, this allows up to 120 16bit parameters or 60 32-bit parameters to be read and / or written in a single transaction. If this is exceeded the server will issue an exception response code 2.

information installation installation started parameters the motor opinitization communication Operation PLC parameters information information	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	Operation			Diagnostics	UL information
---	-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	----------------------	--------------	---------------------	-----------	--	--	-------------	-------------------

Example

To write the value 12345 to drive parameters 0.20.021 through 0.20.023 and read the values of parameters 0.20.024 through 0.20.026 (Transaction ID=42) using standard addressing:

Master request data

Slave response data

Byte	Hex value	Description
0-1	00 2A	Transaction ID (42)
2-3	00 00	Protocol ID (0=TCP/IP)
4-5	00 17	Length (Bytes=6)
6	FF	Unit identifier (FF= Drive)
7	17	Function code (23)
8-9	47 E7	Start read register (20.023)
10-11	00 06	Number of read registers (6)
12-13	47 E4	Start write register (20.020)
14-15	00 06	Number of write registers (6)
16	0C	Length of register data to write (Bytes=12)
17-20	00 00 30 39	Register data 0 (12345)
21-24	00 00 30 39	Register data 1 (12345)

Slave	respon	se data
Byte	Hex value	Description
0-1	00 2A	Transaction ID (42)
2-3	00 00	Protocol ID (0=TCP/IP)
4-5	00 0F	Length (Bytes=15)
6	FF	Unit identifier (FF= Drive)
7	17	Function code (23)
8	0C	Length of data (Bytes=12)
9-12	?? ?? ?? ??	Register data 0 (Pr 20.024)
13-16	?? ?? ?? ??	Register data 1 (Pr 20.025)
17-20	?? ?? ?? ??	Register data 2 (Pr 20.026)

9.3.10 Modbus Exception Response Message

If the master request is rejected then an exception response message will be eturned.

Exception Response Message

Byte	Hex value	Description
0-1	?? ??	Transaction ID (defined by Modbus Master)
2-3	00 00	Protocol ID
4-5	00 03	Number of data bytes to follow
6	??	Unit identifier
7	??	Function code (request FC with bit b7 set to 1)
8	??	Exception code 01 = Function code not supported 02 = Invalid register address

The master request function code will be returned but with bit b7 set (e.g. function code 0x03 will be returned as 0x83).

9.4 RTMoE (Real Time Motion over Ethernet) (Unidrive M700 / M702)

This is a communication protocol developed to provide Ethernet synchronisation and data transfer between Control Techniques drives.

RTMoE provides:

 Drive synchronization using the Precision Time Protocol (PTP) otherwise known as IEEE1588 V2

Each PTP device has a tuneable clock running. Following an arbitration process the devices select a master and tune their clocks until they are synchronized to that master. This process may take several seconds to complete.

- Data transfer
 - Cyclic data (synchronous and non-synchronous) is sent using the User Datagram Protocol (UDP)
 - Non-cyclic data is sent using the Transmission Control Protocol (TCP)
- Cycle time down to 250 µs (Using Machine Control Studio)
- Jitter less than 1 µs

RTMoE can be configured in two ways:

- Via Machine Control Studio using the Advanced link editor or
- Via parameters using the Easy Mode menus (10 and 11)

The full capabilities of RTMoE are available only when using Machine Control Studio.

Table 9-16 shows the comparison between Easy Mode and Machine Control Studio support levels.

Table 9-16 RTMoE Support levels

	Suppor	rt Level
Capability	Easy Mode	Machine Control Studio ^{(1) (3)}
Non-cyclic communication	No	Yes
Total number of transmit cyclic links	3	11
Total number of receive cyclic links	3	11
Max transmit synchronous links	1	1
Max receive synchronous links	1	1
Max length of non-synchronous link	10 x 32-bit	10 x 32-bit ⁽²⁾
Max length of synchronous link	3 x 32-bit	3 x 32-bit
Minimum transmission period (non-synchronised)	1 ms	1 ms
Maximum transmission period (non-synchronised)	100 ms	100 ms ⁽³⁾
Minimum transmission period (Synchronised)	1 ms	250 µs
Maximum transmission period (Synchronised)	8 ms	8 ms
Synchronised with onboard program	Yes (when cycle time = 4 ms)	Yes (when cycle time = 4 ms)
Max parameter accesses per second	6000	6000
Max messages per second (S.02.004)	8000	8000

⁽¹⁾ MCi2x0 firmware version V01.08.04.06 and later.

⁽²⁾ Maximum number of parameter in a non-synchronous links between two MCi210 modules (V01.08.04.06 and later) is 20.

⁽³⁾ Currently the Ethernet interface only supports cyclic links using Easy Mode (Menu 10), cyclic links using Machine Control Studio will be available in a future release of the Ethernet interface firmware.

The number of cyclic links is limited to a maximum of 2 when accessing the option module internal parameters (e.g. the PLC register menus 7x).

9.4.1 RTMoE Message rate capability

When designing a network, the message loading for each device should be checked to ensure the number of messages do not exceed the maximum recommended value.

Consider the following example where a Unidrive M700 is communicating with three other devices over Ethernet using Modbus TCP/IP (10 parameters read every 100 ms), EtherNet/IP (5 parameters read every 10 ms and 5 parameters written every 10 ms) and RTMoE (2 parameters written every 500 μ s).

Protocol	Number of Parameters	Rate	Parameters accessed / second	Message rate / second
Modbus TCP/IP	10 x read	100 ms	100	10
EtherNet/IP	5 x read	10 ms	500	100
	5 x write	10 ms	500	100
RTMoE	2 x write	500 µs	4000	2000
	Total		5100	2210
Maxi	mum supported		6000	8000
Wit	hin capability?		✓	✓

9.4.2 RTMoE Message type

From the system design, it should be known how many drives will be used and what data needs to be sent where. There are two fundamental ways of sharing data:

- Cyclic data use cyclic links for important information relating to the dynamic behavior of the machine (e.g. control word, speed reference, etc.)
- Non-cyclic data used for non time-critical information (e.g. drive setup data) A user program must be used to control the transfer of non-cyclic messages. (see Non cyclic enable (S.02.035) and Non cyclic base parameter (S.02.036))

Each cyclic message can be one of three types:

1 Unicast – used if data needs to go from one device to another

2 Broadcast – used if data needs to go from one device to all other devices

Multicast – used if data needs to go 3 from one device to a subset of the other devices

By choosing the most appropriate transmission type an efficient and reliable network can be designed.

For example:

- Three drives must use an ELS (Electronic Line Shaft) to follow a Smart Drive. In this case a **multicast** message should be used to transmit the reference position from the Smart Drive.
- Three drives need to return general status information to the Smart Drive. In this case, each drive should send a **unicast** message to the Smart Drive.
- The Smart Drive needs to command all other drives to stop/ start. The Smart Drive should use a broadcast message to transmit the command to all the other drives.

Safety	Product	Mechanical	Electrical	Gettina	Basic	Runnina		Drive	NV Media Card	Onboard	Advanced		UL
							Optimization					Diagnostics	
information	information	installation	installation	started	parameters	the motor	opumzation	communication	Operation	PLC	parameters	Diagnostios	information
mormation	information	matanation	installation	Starteu	parameters	the motor		communication	operation	FLU	parameters		mormation

NOTE Broadcast messages should be used with care, bottlenecks in the network can be easily created by using broadcast messages, this will reduce the performance of the network and, in extreme situations, seriously impair the system operation.

9.4.3 Checking for bottlenecks

There are three main reasons why a bottleneck occurs:

- 1. A drive is receiving more Ethernet messages than it can handle (8000 frames per second).
- 2. A drive is being asked to access more parameters than it can handle (6000 parameters per second).
- A segment of the network has reached it's bandwidth limit. For a full duplex 100Mbit/sec Ethernet network, assuming all Ethernet messages are the maximum 1500 bytes in length, the bandwidth is 8000 frames/sec in each direction.

NOTE

It is unrealistic to assume that all messages will be full frames

- In reality the maximum number of frames/sec will be higher
- A more detailed frame analysis may be performed if necessary but the values stated can be used to quickly determine whether bottlenecks could be a problem

9.4.4 RTMoE Message synchronization

Cyclic messages can be synchronized or non-synchronized.

Only one synchronized cyclic link in each direction (one transmit and one receive) is possible so these should only be used for high precision applications where the motion of multiple drives must be closely coupled (e.g. printing applications). All other messages should be sent using a non-synchronized cyclic link.

Synchronized cyclic data links utilise the IEEE1588 clock time distributed across the network. The IEEE1588 clock can synchronize the drive's control loops to within a 1 μ s accuracy, Pr **0.11.002** *Option Synchronisation Active* displays the active option slot providing synchronization. With synchronized control loops the Ethernet interface can be used to transfer drive parameters containing motion information, including those from the AMC.

With normal Ethernet there are a number of variables that can impact upon the performance of the network. These include:

- Delays through switches Ethernet is a switched network and messages are typically copied completely into a switch before being forwarded on. This is fundamental to modern Ethernet and cannot be influenced by system design.
- Message length the longer a message, the longer it will take to transmit and copy into a switch before forwarding it on. For a synchronous cyclic link frame this delay is 12 μs, for a full Ethernet frame it is 120 μs.

Message length can be controlled, but to maximise compatibility with other Ethernet traffic, it is sensible to allow for full frame Ethernet messages where possible.

• Length of daisy chain - A daisy chain with Ethernet is really a chain of three port switches.

This can be controlled through physical network design e.g. using a tree structure to limit the length of daisy chains.

The above delays (Latency) are managed in software, in conjunction with PTP, to ensure that all device use synchronous data at the same time, but the length of the daisy chain must be controlled by careful network design.

9.4.5 General guidelines for synchronous cyclic data

The following guidelines provide a simple way of specifying a network supporting synchronous cyclic data that offers accurate synchronization and guaranteed determinism, whilst maintaining compatibility with standard Ethernet traffic.

- Limit daisy chains to 10 drives
- Where more than 10 drives are used, create a tree structure using a switch
- Any Ethernet switches must support IEEE1588 V2
- Segregate the network using VLANs and gateways
- Assign one device to be the synchronization master for each segregated network

9.4.6 Segregating the network

If synchronous cyclic links are used, for best reliability it is sensible to segregate the network. This means:

- Assign one (or more) drive(s) to be a gateway, which ensures messages entering the segregated section are stripped of any existing prioritisation information. (See *Gateway Mode* (S.02.025)
- Ensure that VLAN (Virtual Local Area Network) is enabled on all devices so that synchronous data can be prioritized as it is passed between switches. (See VLAN Enable (S.02.030))
- Use multiple Master Clock Domains. (See Master Clock Domain (S.11.002))

9.4.7 Synchronization master

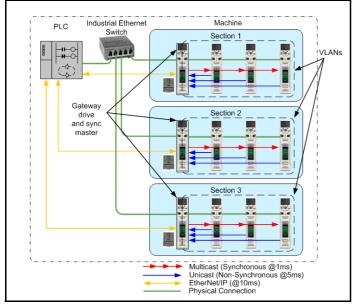

If a synchronous cyclic link is used then one device must be a synchronous master, if this is an existing 3rd party device then, to minimize the initialization time, all other devices/drives on the network should not be allowed to become the synchronous master. To disable the drive from becoming the synchronous master then set the value in *Preferred Sync Master* (S.11.001) to 0, this ensures the drive does not become the synchronous master.

If there is no existing synchronous master then a suitable drive should be chosen (see *Preferred Sync Master* (S.11.001)), in choosing which drive to be the synchronous master, the physical position of the drives and network layout should be considered so as to minimize the number of switches each message has to pass through.

A typical segregated network using VLANs and gateways consisting of three separate sections of a machine controlled by one master PLC is shown in the following diagram.

Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information

Figure 9-4 Typical separately synchronized segregated network

NOTE Configuring a single drive to act as both gateway and synchronization master will increase the message loading on that drive, in some situations this may result in a reduction of the network performance. In these situations, separate drives should be used for the gateway and synchronization master.

NOTE For the gateway mode to operate correctly, the standard Ethernet network must be connected to port 1 on the drive and the real-time Ethernet to port 2 as shown in Figure 9-4.

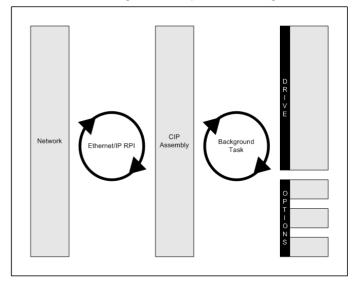

9.4.8 VLANs

To guarantee the timing of synchronous links VLANs must be enabled using VLAN Enable (**S.02.030**). VLANs include a priority field that is applied to all messages. This field is used to apply a higher priority to synchronous cyclic data than other non-deterministic traffic.

9.4.9 Parameter Update Rate

Parameters are exchanged over the network. The value exchanged over the network must be exchanged with the drive or option parameter. The rate of data exchange differs for synchronous and non-synchronous cyclic links as well as for drive and option destinations.

The diagram below depicts the update cycles used within the Ethernet interface. Cyclic link mappings being exchanged with the drive will be updated at the background task rate. This rate (*Background cycles per second* (**S.09.008**)) varies with the load on the Ethernet interface; EtherNet/IP data exchange also takes place in the background task.

9.5 EtherNet/IP specification (Unidrive M700 / M702)

The Ethernet interface supports the EtherNet/IP protocol and conforms to the EtherNet/IP adaptation of the Common Industrial Protocol (CIP) Specification. This is the same upper-layer protocol and object model as used in DeviceNet.

The Ethernet interface module will operate as a slave device and the following functionality is supported:

- Variable length input assembly object (instance 100) with consistency for up to 32 parameters
- Variable length output assembly object (instance 101) with consistency for up to 32 parameters
- User selectable RPI timeout action
- Identity object (class 0x01)
- Motor data object (class 0x28)
- Control supervisor object (class 0x29)
- AC/DC Drive object (class 0x2A)
- Control Techniques objects (classes 0x64 to 0x69)
- Explicit (non-cyclic) access to parameters

9.5.1 Requested Packet Interval (RPI) timeout

This timeout is defined by the EtherNet/IP protocol and is configured in the PLC master. If enabled, the Ethernet interface will monitor the data traffic once the cyclic data has been established, and if data is not received within the specified time, it will perform the requested action as defined by Pr **S.20.011** *RPI timeout action.* This indicates that the interface has detected that the cyclic data communication has been interrupted.

NOTE The RPI timeout action will only occur on a loss of cyclic data message, i.e. after cyclic data has been established and subsequently lost. No action will be taken if no cyclic data has been detected.

	Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	Drive	NV Media Card	Onboard	Advanced	Diagnostica	UL
i	information	information	installation	installation	started	parameters	the motor	Optimization	communication	Operation	PLC	parameters	Diagnostics	information

9.5.2 Read consistency

Under normal conditions, cyclic data is sampled and transmitted at the Requested Packet Interval (RPI). However, if an option module was in the process of modifying the mapped parameters while these parameters were being sampled, then the data transmitted across the network may not be consistent across the entire assembly object. If read consistency is enabled (**S.20.026** *In Consistency Enable*) and a trigger parameter specified in *In Consistency Trigger Param* (**S.20.027**) then data will only be sampled and transmitted when the trigger parameter *In Consistency Trigger Param* (**S.20.027**) contains a non-zero value. This trigger parameter will then be set to zero after the data has been sampled.

It is therefore possible, by controlling the trigger parameters, that a user program in the drive or option module can ensure that the values in the cyclic data parameters are not sampled until all values are updated.

Whether consistency is enabled or not, data will always be consistent for an individual parameter, i.e. all 4 bytes of a 32-bit value will be consistent.

9.5.3 Write consistency

Under normal conditions, cyclic data is sampled and written at the Requested Packet Interval (RPI). However, if an option module was in the process of reading the mapped parameters while these parameters were being written, then the data obtained may not be consistent across the entire assembly object. If write consistency is enabled (*Out Consistency Enable* (S.20.028)) and a trigger parameter specified in *Out Consistency Trigger Param* (S.20.029) then new data will only be written to the drive (or option module) when the trigger parameter *Out Consistency Trigger Param* (S.20.029) contains a value of zero. This trigger parameter will then be set to one after the data has been written.

It is therefore possible, by controlling the trigger parameters, that a user program in the drive or option module can ensure that the values in the cyclic data parameters are not sampled until all values are updated.

Whether consistency is enabled or not, data will always be consistent for an individual parameter, i.e. all 4 bytes of a 32-bit value will be consistent.

Example

In this example, Pr **0.18.031** is set as the input trigger and Pr **0.18.032** is set as the output trigger. The EtherNet/IP master is configured to check the values of Pr **0.20.011** and Pr **0.20.012** are equal and write the same value to Pr **0.20.021**. The SI-Applications Plus module is configured to generate a ramp value between -32768 and 32767 to write to Pr **0.20.011** and Pr **0.20.012** when the value of Pr **0.20.021** is equal to the ramp value.

With the input and output consistency enabled, parameters Pr 0.20.011and Pr 0.20.012 will be sampled and transmitted to the EtherNet/IP master when the input trigger parameter Pr 0.18.031 is a non-zero value, Pr 0.20.021 will be written to when the output trigger parameter Pr 0.18.032 is a value of zero.

The parameter changes required are:

S.20.020 Input assembly object size	= 8 (bytes)
S.20.021 Output assembly object size	= 4 (bytes)
S.20.026 In Consistency Enable	= On
S.20.027 In Consistency Trigger Param	= 0.18.031
S.20.028 Out Consistency Enable	= On
S.20.029 Out Consistency Trigger Param	= 0.18.032
S.21.001 Input mapping parameter 1	= 0.20.011
S.21.002 Input mapping parameter 2	= 0.20.012
S.22.001 Output mapping parameter 1	= 0.20.021

The user program in the SI-Applications Plus module may be written as follows (some changes may be necessary to account for bus cycle times and parameter update rates):

Initial{

// Initialise variables

NewValue% = 0 #86.03 = 0 // Set digital output0 off #86.04 = 0 // Set digital output1 off #20.011 = 0 // Set input parameter 1 to 0 #20.021 = 0 // Set input parameter 2 to 0 #20.021 = 0 // Set output parameter 1 to 0 REINIT // Initialise configuration

} //Initial

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Ortinization	Drive	NV Media Card	Onboard	Advanced	Discussofies	UL
information	information	installation	installation	started	parameters	the motor	Optimization	communication	Operation	PLC	parameters	Diagnostics	information

9.5.4 Non-cyclic (explicit) data transfer

Non-cyclic or explicit messaging is used to read and write parameters non-cyclically by means of assembly objects. All of the AC Drives profile attributes can be accessed using explicit messaging.

The *Control Techniques* objects provide access to all drive and slot parameters using the following format.

Object	CT Group	CT This Slot	CT Slot 1	CT Slot 2	CT Slot 3	CT Slot 4
Class code	100 (0x64)	101 (0x65)	102 (0x66)	103 (0x67)	104 (0x68)	105 (0x69)
Instance			Me	enu		
Attribute			Para	neter		
Read code		14 (0x0E) Get_	Attribute_Si	ngle	
Write code		16 (0x10) Set_/	Attribute_Si	ngle	

NOTE An instance value of 0 is not a valid value in this context, therefore an instance value of 200 (0xC8) should be used to access menu 0 parameters. For more information on the *Control Techniques* object see section 9.5.21 *Control Techniques objects* on page 134.

9.5.5 Cyclic (implicit or polled) data transfer

Cyclic data is a method of data transfer that must be setup during network configuration, but is transmitted automatically at the determined rate once configuration is complete.

EtherNet/IP transfers cyclic data using assembly objects, "cyclic data" is sometimes referred to as "Polled data" or "implicit data".

The terms "input" and "output" refer to data from the perspective of the PLC, an "output" assembly object transfers data from the PLC to the drive, an "input" assembly object transfers data from the drive to the PLC.

NOTE Some PLCs provide the option of transmitting a configuration assembly object. The Ethernet interface does not use a configuration object; if one is required by the PLC then instance 1 should be specified with a length of 0 bytes.

9.5.6 Configuring EtherNet/IP cyclic parameters

In order to use cyclic data over EtherNet/IP, the EtherNet/IP interface must be configured to map the required parameter data to the assembly object.

For drive parameter access, object 100 (0x64) is used for reading parameters and object 101 (0x65) is used for writing parameters. The pre-defined assembly objects as listed in Table 9-17 *Supported drive assembly objects* can also be configured as cyclic data.

9.5.7 Assembly objects

An assembly object is an object which contains a group of attributes to control or monitor the drive operation. These attributes can be members of EtherNet/IP objects or drive parameters. The Ethernet interface supports a series of standard assembly objects and two *Control Techniques* objects (100 and 101) to access the drive parameters (see Table 9-17 *Supported drive assembly objects* on page 125).

NOTE Conformance with the pre-defined assembly objects specification can only be guaranteed if the speed reference configuration of the drive has not been changed from the default settings. For information on setting default values, refer to the appropriate drive user guide.

Table 9-17 Supported drive assembly objects

Assembly	Clas	Class Length			Default N	lappings
object name	Decimal	Hex (0x)	(Bytes)	Туре	Bytes 0 to 3	Bytes 4 to 7
Primaryl	100	64	4 to 80	Input	0.10.040	0.02.001
BscSpdCtrll	70	46	4	Input		
ExtSpdCtrll	71	47	4	Input		
SpdTrqCtrll	72	48	6	Input		
ExtSpdTrqCtrll	73	49	6	Input

SpdTrqCtrlO	22	16	6	Output		
ExtSpdTrqCtrlO	23	17	6	Output		

9.5.8 Basic speed control Output assembly object 0x14 (20₁₀)

The PLC or scanner must be configured for 4 output bytes (or 2 output words) if this assembly object is to be used.

Table 9-18 Basic speed control

Data word	Function
Word 0	Basic control word.
Word 1	Speed reference (SpeedRef).

Basic control word

The basic control word consists of 2 bytes (16 bits), with only 2 bits of the low byte being used as shown below.

b15	b14	b13	b12	b11	b10	b9	b8
b7	b6	b5	b4	b3	b2	b1	b0
					FaultRst		RunFwd

The individual bit functions are described as follows:

Name	Control Word	Description
RunFwd	b0	Set this bit to command the drive to run in the forward direction.
FaultRst	b2	A 0 to 1 transition will reset the drive if the drive was in a trip state.

 NOTE
 For the drive to run at the speed specified in Word 1,

 Pr 0.06.043 must be ON and bit 0, bit 7 and bit 8 of the drive control word (Pr 0.06.042) must all be set to 1 and the

external hardware enable signal must be present.

Safety Product Mechanical Electrical Getting Basic Running Optimization Drive NV Media Card Onboard Advanced Diagnostics UL	Safety information	Product information	Mechanical installation	Electrical installation	Getting started		Running the motor	Optimization	Drive communication	-	PL C	Advanced parameters	Diagnostics	UL information
---	-----------------------	------------------------	----------------------------	----------------------------	--------------------	--	----------------------	--------------	---------------------	---	------	------------------------	-------------	-------------------

The individual bit functions for the drive control word are shown in Table 9-19 below.

Table 9-19 Drive control word bit functions

Bit	Function	Equivalent parameter
0	Drive enable	Pr 0.06.015
1	Run forward	Pr 0.06.030
2	Jog forward	Pr 0.06.031
3	Run reverse	Pr 0.06.032

13	Reset drive	Pr 0.10.033
14	Keypad watchdog	N/A

Speed reference (SpeedRef)

The speed reference word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8	
	SpeedRef (high byte)							
b7	b6	b5	b4	b3	b2	b1	b0	

For more information on the setting of the speed reference see Table 9-40 *AC/DC Drive object attributes* on page 133.

9.5.9 Extended speed control

Output assembly object 0x15 (2110)

The PLC or scanner must be configured for 4 output bytes (or 2 output words) if this assembly object is to be used.

Table 9-20 Extended speed control

Data word	Function
Word 0	Extended control word.
Word 1	Speed reference (SpeedRef).

Extended control word

The extended control word consists of 2 bytes (16 bits), with only the low byte used as shown.

b15	b14	b13	b12	b11	b10	b9	b8
b7	b6	b5	b4	b3	b2	b1	b0

The individual bit functions are described as follows:

Name	Control Word	Description
RunFwd	b0	Set this bit to command the drive to run in the forward direction.
RunRev	b1	Set this bit to command the drive to run in the reverse direction.
FaultRst	b2	A 0 to 1 transition will reset the drive if the drive was in a trip state.
NetCtrl	b5	Used in conjunction with Pr 0.06.043 to enable the drive control word bits b0-b6 and bit 9 (Pr 0.06.042).
NetRef	b6	Set this bit to command the drive to use the remote speed reference value specified in Word 1.

NOTE For the drive to run at the speed specified in Word 1, Pr 0.06.043 must be ON and bit 0, bit 7 and bit 8 of the drive

control word (Pr **0.06.042**) must all be set to 1 and the external hardware enable signal must be present.

Note For information on the drive control word see Table 9-19 *Drive control word bit functions* on page 126.

NOTE Conformance with the pre-defined assembly objects specification can only be guaranteed if the speed reference configuration of the drive has not been changed from the default settings. For information on setting default values, refer to the appropriate drive user guide.

Speed reference (SpeedRef)

The speed reference word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8	
SpeedRef (high byte)								
b7	b6	b5	b4	b3	b2	b1	b0	

For more information on the setting of the speed reference see Table 9-40 AC/DC Drive object attributes on page 133.

9.5.10 Basic speed and torque control Output assembly object 0x16 (22₁₀)

The PLC or scanner must be configured for 6 output bytes (or 3 output words) if this assembly object is to be used.

Table 9-21 Basic speed and torque control

Data Word	Function
Word 0	Basic control word.
Word 1	Speed reference (SpeedRef).
Word 2	Torque reference (TorqueRef).

Basic control word

The basic control word consists of 2 bytes (16 bits), with only 2 bits of the low byte being used as shown below.

b15	b14	b13	b12	b11	b10	b9	b8
b7	b6	b5	b4	b3	b2	b1	b0
					FaultRst		RunFwd

The individual bit functions are described as follows:

Name	Control Word	Description
RunFwd	b0	Set this bit to command the drive to run in the forward direction.
FaultRst	b2	A 0 to 1 transition will reset the drive if the drive was in a trip state.

NOTE For the drive to run at the speed specified in Word 1, Pr 0.06.043 must be ON and bit 0, bit 7 and bit 8 of the drive control word (Pr0.06.043) must all be set to 1.

I	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
						-				-		-		

NOTE For information on the drive control word see Table 9-19 Drive control word bit functions on page 126.

Speed reference (SpeedRef)

The speed reference word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8			
	SpeedRef (high byte)									
b7	b6	b5	b4	b3	b2	b1	b0			

For more information on the setting of the speed reference see Table 9-40 *AC/DC Drive object attributes* on page 133.

Torque reference (TorqueRef)

The torque reference word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8		
TorqueRef (high byte)									
b7	b6	b5	b4	b3	b2	b1	b0		
TorqueRef (low byte)									

For more information on the setting of the torque reference see Table 9-40 AC/DC Drive object attributes on page 133.

9.5.11 Extended speed and torque control Output assembly object 0x17 (23₁₀)

The PLC or scanner must be configured for 6 output bytes (or 3 output words) if this assembly object is to be used.

Table 9-22 Extended speed and torque control

Data word	Function
Word 0	Extended control word.
Word 1	Speed reference (SpeedRef).
Word 2	Torque reference (TorqueRef).

Extended control word

The extended control word consists of 2 bytes (16 bits), with only 5 bits of the low byte used as shown below.

b15	b14	b13	b12	b11	b10	b9	b8
b7	b6	b5	b4	b3	b2	b1	b0
	NetRef	NetCtrl			FaultRst	RunRev	RunFwd

The individual bit functions are described as follows:

Name	Control Word	Description
RunFwd	b0	Set this bit to command the drive to run in the forward direction.
RunRev	b1	Set this bit to command the drive to run in the reverse direction.
FaultRst	b2	A 0 to 1 transition will reset the drive if the drive was in a trip state.
NetCtrl	b5	Used in conjunction with Pr 06.043 to enable the drive control word bits b0-b6 and bit 9 (Pr 06.042).
NetRef	b6	Set this bit to command the drive to use the remote speed reference value specified in Word 1.

 NOTE
 For the drive to run at the speed specified in Word 1,

 Pr 06.043 must be ON and bit 0, bit 7 and bit 8 of the drive control word (Pr 06.042) must all be set to 1 and the external hardware enable signal must be present.

NOTE For information on the drive control word see Table 9-19 Drive control word bit functions on page 126.

Speed reference (SpeedRef)

The speed reference word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8			
	SpeedRef (high byte)									
b7 b6 b5 b4 b3 b2 b1 b0										
b7	b6	b5	b4	b3	b2	b1	b0			

For more information on the setting of the speed reference see Table 9-40 *AC/DC Drive object attributes* on page 133.

Torque reference (TorqueRef)

The torque reference word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8		
TorqueRef (high byte)									
b7 b6 b5 b4 b3 b2 b1 b0									
b7	b6	b5	b4	b3	b2	b1	b0		

For more information on the setting of the torque reference see Table 9-40 *AC/DC Drive object attributes* on page 133.

9.5.12 Basic speed feedback

Input assembly object 0x46 (7010)

The PLC or scanner must be configured for 4 input bytes (or 2 input words) if this assembly object is to be used.

Table 9-23 Basic speed feedback

Data word	Function
Word 0	Basic status word.
Word 1	Speed feedback (SpeedActual).

Basic status word

The basic status word consists of 2 bytes (16 bits), with only 2 bits of the low byte used as shown below.

b15	b14	b13	b12	b11	b10	b9	b8
b7	b6	b5	b4	b3	b2	b1	b0
					Running 1 (Fwd)		Faulted

The individual bit functions are described as follows:

Bit	Name	Description
b0	Faulted	Indicates whether the drive is OK or tripped (0=OK, 1=Tripped).
b2	Running1 (Fwd)	Indicates if the drive is running in the forward direction (0=False, 1=True).

Speed feedback (SpeedActual)

The speed feedback word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8
		S	peedActua	ıl (high byte	e)		
b7	b6	b5	b4	b3	b2	b1	b0
57	00		N-T		N2		

For more information on the speed feedback see Table 9-40 AC/DC Drive object attributes on page 133.

Safety information Product information Mechanical installation Electrical installation Getting started Basic parameters Running the motor Optimization Drive communication NV Media Card Onboard Advanced parameters Diagnostics initiality	UL information
--	-------------------

9.5.13 Extended speed feedback

Input assembly object 0x47 (71₁₀)

The PLC or scanner must be configured for 4 input bytes (or 2 input words) if this assembly object is to be used.

Table 9-24 Extended speed feedback

Data word	Function
Word 0	Extended status word.
Word 1	Speed feedback (SpeedActual).

Extended status word

The extended status word consists of 2 bytes (16 bits), with the bits having functions as shown below.

b15	b14	b13	b12	b11	b10	b9	b8
			Drives	State			
b7	b6	b5	b4	b3	b2	b1	b0
At	RefFrom	CtrlFrom			Running1		1

The DriveState byte returns a code to indicate the operating state of the drive as shown in Table 9-25 following.

Table 9-25 DriveState codes

Code	b15 - b8	State	Description
1	00000001	Startup	This state is skipped over on CT drives.
2	00000010	Not_Ready	Inhibit.
3	00000011	Ready	Ready.
4	00000100	Enabled	Run or Stop.
5	00000101	Stopping	Deceleration or Injection.
6	00000110	Fault_Stop	AC_UU (this will only occur if Mains Loss is enabled).
7	00000111	Faulted	Tripped.
0	00000000	Vendor Specific	All other DriveType states, e.g. Scan, Orienting, Regen Active, etc.

The individual bits of the low byte of the extended status word are described below.

Extended status word (low byte)

Name	Bit	Description
Faulted	b0	Indicates whether the drive is OK or tripped. 0=OK (Pr 0.10.001 =1). 1=Tripped (Pr 0.10.001 =0).
Warning	b1	Indicates if one of the drive alarms is active.
Running1 (Fwd)	b2	Indicates if the drive is running in the forward direction. 0=False, 1=True.
Running2 (Rev)	b3	Indicates if the drive is running in the reverse direction. 0=False, 1=True.
Ready	b4	The 'Ready' bit is set depending on which state the drive is in. Ready = True. Enabled = True. Stopping = True. All others = False.
CtrlFromNet	b5	Indicates if the drive is being controlled from the 'Drive Control Word'. 0=False, 1=True.
RefFromNet	b6	Indicates if the speed reference is derived from Pr 0.01.021. 0=False (Pr 0.01.050 <>1 OR Pr 0.01.049 <>3). 1=True (Pr 0.01.050 =1 AND Pr 0.01.049 =3).
AtReference	b7	Indicates if the drive speed has reached the set reference. 0=False (Pr 0.10.006 =0). 1=True (Pr 0.10.006 =1).

Speed feedback (SpeedActual)

The speed feedback word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8
		S	peedActua	al (high byt	e)		
b7	b6	b5	b4	b3	b2	b1	b0
	SpeedActual (low byte)						

For more information on the speed feedback see Table 9-40 AC/DC Drive object attributes on page 133.

9.5.14 Basic speed and torque feedback Input assembly object 0x48 (72₁₀)

The PLC or scanner must be configured for 6 input bytes (or 3 input words) if this assembly object is to be used.

Table 9-26 Basic speed and torque feedback

Data word	Function
Word 0	Basic status word.
Word 1	Speed feedback (SpeedActual).
Word 2	Torque feedback (TorqueActual).

Basic status word

The basic status word consists of 2 bytes (16 bits), with only the low byte used as shown below.

b14	b13	b12	b11	b10	b9	b8
b6	b5	b4	b3	b2	b1	b0
				Running1 (Fwd)		Faulted
					b6 b5 b4 b3 b2 Running1	b6 b5 b4 b3 b2 b1 Running1 Runing1 Runing1

The individual bit functions are described as follows:

Bit	Name	Description
b0	Faulted	Indicates whether the drive is OK or tripped (0=OK, 1=Tripped).
b2	Running1 (Fwd)	Indicates if the drive is running in the forward direction (0=False, 1=True).

Speed feedback (SpeedActual)

The speed feedback word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8
		S	peedActua	ıl (high byte	e)		
b7	b6	b5	b4	b3	b2	b1	b0

For more information on the speed feedback see Table 9-40 *AC/DC Drive object attributes* on page 133.

Torque feedback (TorqueActual)

The torque feedback word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8	
TorqueActual (high byte)								
b7	b6	b5	b4	b3	b2	b1	b0	

For more information on the torque feedback see Table 9-40 *AC/DC Drive object attributes* on page 133.

	ſ	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
--	---	-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	-------------------	--------------	---------------------	----------------------------	----------------	------------------------	-------------	-------------------

9.5.15 Extended speed and torque feedback Input assembly object 0x49 (73₁₀)

The PLC or scanner must be configured for 6 input bytes (or 3 input words) if this assembly object is to be used.

Table 9-27 Basic speed and torque feedback

Data word	Function
Word 0	Extended status word.
Word 1	Speed feedback (SpeedActual).
Word 2	Torque feedback (<i>TorqueActual</i>).

Extended status word

The extended status word consists of 2 bytes (16 bits), with the bits having functions as shown below.

b15	b14	b13	b12	b11	b10	b9	b8		
DriveState									
b7	b6	b5	b4	b3	b2	b1	b0		
At Reference	RefFrom Net	CtrlFrom Net	Ready	Running2 (Rev)	Running1 (Fwd)	Warning	Faulted		

The DriveState byte returns a code to indicate the operating state of the drive as shown in Table 9-28.

Table 9-28 DriveState codes

Code	b15 - b8	State	Description
1	00000001	Startup	This state is skipped over on CT drives.
2	00000010	Not_Ready	Inhibit.
3	00000011	Ready	Ready.
4	00000100	Enabled	Run or Stop.
5	00000101	Stopping	Deceleration or Injection.
6	00000110	Fault_Stop	AC_UU (this will only occur if Mains Loss is enabled).
7	00000111	Faulted	Tripped.
0	0000000	Vendor Specific	All other DriveType states, e.g. Scan, Orienting, Regen Active, etc.

The individual bits of the low byte of the extended status word are described in Table 9-29 *Extended status word (low byte)* on page 129.

Table 9-29 Extended status word (low byte)

Name	Bit	Description
Faulted	b0	Indicates whether the drive is OK or tripped. 0=OK (Pr 0.10.001 =1). 1=Tripped (Pr 0.10.001 =0).
Warning	b1	Indicates if one of the drive alarms is active.
Running1 (Fwd)	b2	Indicates if the drive is running in the forward direction. 0=False, 1=True.
Running2 (Rev)	b3	Indicates if the drive is running in the reverse direction. 0=False, 1=True.
Ready	b4	The 'Ready' bit is set depending on which state the drive is in. Ready = True. Enabled = True. Stopping = True. All others = False.
CtrlFromNet	b5	Indicates if the drive is being controlled from the 'Drive Control Word'. 0=False, 1=True.
RefFromNet	b6	Indicates if the speed reference is derived from Pr 0.01.021. 0=False (Pr 0.01.050 <>1 OR Pr 0.01.049 <>3). 1=True (Pr 0.01.050 =1 AND Pr 0.01.049 =3).
AtReference	b7	Indicates if the drive speed has reached the set reference. 0=False (Pr 0.10.006 =0). 1=True (Pr 0.10.006 =1).

Speed feedback (SpeedActual)

The speed feedback word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8	
SpeedActuall(high byte)								
b7 b6 b5 b4 b3 b2 b1 b0								
b7	b6	b5	b4	b3	b2	b1	b0	

For more information on the speed feedback see Table 9-40 *AC/DC Drive object attributes* on page 133.

Torque feedback (TorqueActual)

The torque feedback word utilises 2 bytes (16 bits) as shown below.

b15	b14	b13	b12	b11	b10	b9	b8		
	TorqueActual (high byte)								
b 7									
07	00	55	N 4	05	01				

For more information on the torque feedback see Table 9-40 AC/DC Drive object attributes on page 133.

9.5.16 Object Model

The Object Model has the following object classes present.

Table 9-30 Supported Objects

	Class C	ode	Number of	
Object Class	Decimal	Hex (0x)	Instances	Effect
Identity	1	01	1	Provides device specific information.
Assembly	4	04	16	Defines the I/O data format (parameter mapping).
Motor Data	40	28	2	Defines the motor data.
Control Supervisor	41	29	1	Provides drive control and monitoring information.
AC/DC Drive	42	2A	1	Provides drive configuration and running state information.
CT Group	100	64	<no menus="" of=""></no>	Provides access to drive parameters.
CT This Slot	101	65	<no. menus="" of=""></no.>	Provides access to the local option module parameters.
CT Slot 1	102	66	<no. menus="" of=""></no.>	Provides access to the option module parameters in slot 1.
CT Slot 2	103	67		Provides access to the option module parameters in slot 2.
CT Slot 3	104	68		Provides access to the option module parameters in slot 3.
CT Slot 4	105	69	<no. menus="" of=""></no.>	Provides access to the onboard Ethernet interface parameters.

9.5.17 Identity object

Class: 0x01 (110)

The identity object provides identification of and general information about the device.

Table 9-31 Identity object

Attribute	Access	Name	Data Type
1	Get	VendorID	UINT
2	Get	DeviceType	UINT
3	Get	ProductCode	UINT
4	Get	Revision	USINT
6	Get	SerialNumber	UDINT
7	Get	ProductName	SHORT_STRING

Safe		Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	Drive	NV Media Card	Onboard	Advanced	Diagnostics	UL
inform	ation	information	installation	installation	started	parameters	the motor	•••	communication	Operation	PLC	parameters		information

Vendor ID

Name:	VendorID		
Class	0x01	Default	0x101 (257 ₁₀)
Instance	0x01	Data Type	UINT
Attribute	0x01	Access	Get

Returns the vendor ID code 0x101 (257₁₀) for *Control Techniques*.

Device type

Name:	DeviceType		
Class	0x01	Default	0x02
Instance	0x01	Data Type	UINT
Attribute	0x02	Access	Get

Returns the device type code. The following codes are used:

Device Type code	Drive type
0x02	AC Drive

Product code

Name:	Product Co	de	
Class	0x01	Default	See below
Instance	0x01	Data Type	UINT
Attribute	0x03	Access	Get

Returns a 16 bit value to identify the drive type and drive mode and also links a node to the installed EDS files. The product code is calculated as shown in Table 9-32 *Product code bit allocation* below.

Table 9-32 Product code bit allocation

k	o15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	Drive Type		Drive Derivative				Dri	Drive Mode			CIP code					

Drive Type (b15 to b11)

The drive type is defined as follows:

Value	Drive Type
2	Unidrive M

Drive Derivative (b10 to b6)

The drive derivative as shown in Pr 0.11.028.

For more information on the drive derivative codes please refer to the relevant drive documentation.

Drive Mode (b5 to b3)

The drive operating mode is defined as follows:

Value	Operating Mode
0	Open-loop
1	RFC-A
2	RFC-S
3	Regen

CIP code (b2 to b0)

The CIP (Common Industrial Protocol) interface code is defined as follows:

Value	Interface ID	Description
0	430	Unidrive M700 onboard Ethernet
1	447	SI-DeviceNet
2	310	MCi210
3	433	SI-Ethernet

Revision

Name:	Revision		
Class	0x01	Default	N/A
Instance	0x01	Data Type	ARRAY of USINT
Attribute	0x04	Access	Get

Returns 2 bytes to indicate the major and minor revision numbers of the Ethernet interface firmware version.

The Ethernet interface firmware version (**MM.002**) consists of four 2-digit decimal numbers with the following significance:

[Major].[Minor].[Bugfix].[Build].

The revision code returns the major and minor revisions of the Ethernet interface firmware version in two unsigned bytes, the major revision being returned first followed by the minor revision.

Table 9-33 Revision specification

b7	b6	b5	b4	b3	b2	b1	b0	
Major revision (MM.002 / 1000000)								
R	R Minor revision (MM.002 / 10000) Mod 100							

Where "Mod 100" refers to the fractional value of the result from **MM.002**/10000, (the value after the decimal point).

e.g. For a value of 12345678 in Pr MM.002 (12.34.56.78 on the keypad display), the major revision is 12 and the minor revision is 34.

The returned data will consist of 2 unsigned bytes, the first byte will be the major revision value 12 (0x0C) and the second byte will be the minor revision value 34 (0x22).

Major revision

b7	b6	b5	b4	b3	b2	b1	b0	
0	0	0	0	1	1	0	0	
Major revision = 12 (0x0C)								

Minor revision

b6	b5	b4	b3	b2	b1	b0	
0	1	0	0	0	1	0	
	Minor revision = 34 (0x22)						

Serial Number

Name:	SerialNumb	ber		
Class	0x01	Default	N/A	
Instance	0x01	Data Type	UDINT	
Attribute	0x06	Access	Get	

Returns the lower 4 bytes (32 bits) of the Ethernet interface serial number.

The Ethernet interface serial number is contained within two adjacent parameters, Pr **MM.004** *Serial Number LS* displays the least 8 significant decimal digits and Pr **MM.005** *Serial Number MS* displays the most 8 significant decimal digits.

For example, if the serial number of the onboard Ethernet interface is 123456789 then Pr **MM.005** *Serial Number MS* will display 1 and Pr **MM.004** *Serial Number LS* will display 23456789.

The Ethernet interface serial number is set during manufacture and cannot be changed.

Product Name

Name:	Produc	ProductName				
Class	0x01	Default	Onboard Ethernet	Factory Fitted Ethernet		
01835	0,01	Deluan	SI-Ethernet	SI-Ethernet		
Instance	0x01	Data Type	SHORT_STRING			
Attribute	0x07	Access	Get			

Returns the product name as a short string of ASCII Bytes. The first byte specifies the number of following bytes that constitute the product name.

9.5.18 Motor data object

Class: 0x28 (4010)

There are 2 instances of the Motor data object. Instance 1 will represent menu 5 motor information (motor 1) and instance 2 will represent menu 21 motor information (motor 2). The instance being used by the other dependant objects will be determined by Pr 0.11.045, to use the second motor map objects (instance 2), Pr 0.11.045 should be set to *Motor 2*. Pr 0.11.045 is polled in the background task, so the user should be

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	Drive	NV Media Card	Onboard		Diagnostics	UL
information	information	installation	installation	started	parameters	the motor	-	communication	Operation	PLC	parameters	5	information

aware that during motor map changeover, the RPM speed reference may not be accurate. The available attributes and associated functions for the AC motor data object are shown in Table 9-34 AC Motor data object attributes below.

Table 9-34 AC Motor data object attributes

AC Moto	or Instance Attri	butes	Drive P	arameter
Attribute ID	Name	Access	Instance 1	Instance 2
0x03 (3 ₁₀)	MotorType (*)	Get/Set	None	None

0.00.1 (10010)	101012061601	Set	Pr 0.11.045	Pr 0.11.045

(* The MotorType attribute has no effect on drive operation, it is only used to provide information to the user as shown in Table 9-35 *Supported motor types* below).

Table 9-35 Supported motor types

Value	Motor Type			
6	Wound rotor induction motor			
7	Squirrel cage induction motor (default)			
9	Sinusoidal PM BL motor			
10	Trapezoidal PM BL motor			

NOTE In Open loop mode, only values 6 and 7 will be supported.

Motor type

Name:	MotorType1			
Class	0x28	Default	7	
Instance	0x01	Data Type	USINT	
Attribute	0x03	Access	Get/Set	
				_

Returns or sets the motor type to be used by the drive for instance 1.

Name:	MotorType2	2		
Class	0x28	Default	7	
Instance	0x02	Data Type	USINT	
Attribute	0x03	Access	Get/Set	

Returns or sets the motor type to be used by the drive for instance 2.

Rated current

Name:	RatedCurre	nt1	
Class	0x28	Default	Pr 0.05.007 / 10
Instance	0x01	Data Type	USINT
Attribute	0x06	Access	Get/Set

Returns or sets the rated motor current in Amps for instance 1. This attribute is linked to Pr **0.05.007**.

- Set Pr 0.05.007 = RatedCurrent1 * 10.
- Get RatedCurrent1 = Pr 0.05.007 / 10.

Name:	RatedCurrent2		
Class	0x28	Default	Pr 0.21.007 / 10
Instance	0x02	Data Type	USINT
Attribute	0x06	Access	Get/Set

Returns or sets the rated motor current in Amps for instance 2. This attribute is linked to Pr **0.21.007**.

Set Pr 0.21.007 = RatedCurrent2 * 10.

Get RatedCurrent2 = Pr 0.21.007 / 10.

Rated voltage

Name:	RatedVoltag	ge1		
Class	0x28	Default	Pr 0.05.009	
Instance	0x01	Data Type	USINT	
Attribute	0x07	Access	Get/Set	

Returns or sets the rated motor voltage in Volts for instance 1. This attribute is linked to Pr **0.05.009**.

Name:	RatedVoltage2		
Class	0x28	Default	Pr 0.21.009
Instance	0x02	Data Type	USINT
Attribute	0x07	Access	Get/Set

Returns or sets the rated motor voltage in Volts for instance 2. This attribute is linked to Pr **0.21.009**.

Rated frequency

Name:	RatedFreq1		
Class	0x28	Default	Pr 0.05.006 / 10
Instance	0x01	Data Type	USINT
Attribute	0x09	Access	Get/Set

Returns or sets the rated motor frequency in Hertz for instance 1. This attribute is linked to Pr **0.05.006**.

Set Pr 0.05.006 = RatedFreq1 * 10.

Get RatedFreq1 = Pr 0.05.006 / 10.

Name:	RatedFreq2		
Class	0x28	Default	Pr 0.21.006 / 10
Instance	0x02	Data Type	USINT
Attribute	0x09	Access	Get/Set

Returns or sets the rated motor frequency in Hertz for instance 2. This attribute is linked to Pr **21.006**.

- Set Pr 0.21.006 =RatedFreq2 * 10.
- Get RatedFreq2 = Pr 0.21.006 / 10.

Base speed

Name:	BaseSpeed1		
Class	0x28	Default	Pr 0.05.008
Instance	0x01	Data Type	USINT
Attribute	0x0F	Access	Get/Set

Returns or sets the base speed of the motor in RPM for instance 1. This attribute is linked to Pr **0.05.008**.

Name:	BaseSpeed	2		
Class	0x28	Default	Pr 0.21.008	
Instance	0x02	Data Type	USINT	
Attribute	0x0F	Access	Get/Set	

Returns or sets the base speed of the motor in RPM for instance 2. This attribute is linked to Pr 0.21.008.

Motor2Select

Name:	Motor2Select		
Class	0x28	Default	
Instance	0x01	Data Type	USINT
Attribute	0x64	Access	Get/Set

Selects between Motor 1 and Motor 2. This attribute is linked to Pr **0.11.045**. When this bit is set to 1, Motor 2 will be active.

NOTE Any change in this attribute will be implemented when the drive is disabled.

9.5.19 Control Supervisor object

Class: 0x29 (4110)

The Control Supervisor object provides access to various attributes which control or monitor the drive running state. The available attributes and their associated functions are shown in Table 9-36 following.

Table 9-36 Control Supervisor object attribute

Attribut	Attribute ID					
Decimal	Hex (0x)	Access	Name	Parameter dependence		
3	03	Get/Set	RunFwd		0.06.042 bit1	
4	04	Get/Set	RunRev		0.06.042 bit3	
5	05	Get/Set	NetCtrl		0.06.042 bit7	
6	06	Get	State		See Table 9-37 Control Supervisor state attributes on page 132	
				1	(0.10.040 AND 0x2002) = 0x0002	
7	07	Get	RunningFwd	0	(0.10.040 AND 0x2002) <> 0x0002	
				1	(0.10.040 AND 0x2002) = 0x2002	
8	08	Get	RunningRev	0	(0.10.040 AND 0x2002) <> 0x2002	
9	09	Get	Ready		See Table 9-37 Control Supervisor state attributes on page 132	
10	0A	Get	Faulted		Inverse of 0.10.001	
11	0B	Get	Warning		0.10.019	
12	0C	Get/Set	FaultRst		Sets 0.10.038 to 100 on a 0 to 1 transition	
13	0D	Get	FaultCode		See Table 9-37 Control Supervisor state attributes on page 132	
15	0F	Get	CtrlFromNet		0.06.042 bit7 AND 0.06.043	
102	66	Get/Set	DriveEnable		0.06.042 bit0	

RunFwd

Name:	RunFwd			
Class	0x29	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x03	Access	Get/Set	

Set to 1 to run the drive in the forward direction.

Get/Set Pr 0.06.042 (bit 1).

RunRev

Name:	RunRev		
Class	0x29	Default	N/A
Instance	0x01	Data Type	USINT
Attribute	0x04	Access	Get/Set

Set to 1 to run the drive in the reverse direction.

Get/Set Pr 0.06.042 (bit 3).

NetCtrl

Name:	NetCtrl					
Class	0x29	Default	N/A			
Instance	0x01	Data Type	USINT			
Attribute	0x05	Access	Get/Set			

Switches between terminal and fieldbus control.

Get/Set Pr 0.06.042 (bit 7)

0 = Terminal control.

1 = Fieldbus control.

State

Name:	State		
Class	0x29	Default	N/A
Instance	0x01	Data Type	USINT
Attribute	0x06	Access	Get

This returns a code to indicate the current running state of the drive as shown in Table 9-37 following.

Table 9-37 Control Supervisor state attributes

Code	State	Parameter Dependence	Description
1	Startup	N/A	This state is skipped over
2	Not_Ready	0.10.101 = 0	Inhibit
3	Ready	0.10.101 = 1	Ready
4	Enabled	0.10.101 = 2 OR 0.10.101 = 4	Stop or Run
5	Stopping		Decelerating or DC injection braking
6	Fault_Stop	0.10.101 = 5	AC supply loss
7	Faulted	0.10.101 = 9	Tripped
0	Vendor Specific	$1111111 = \Delta 11 \text{ other drive states}$	See parameter reference guide

RunningFwd

Name:	RunningFw	'd		
Class	0x29	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x07	Access	Get	

Indicates that the drive is running in the forward direction.

This attribute will be set to 1 when Pr 0.10.014 = 0 and Pr 0.10.002 = 1.

RunningRev

Name:	RunningRev			
Class	0x29	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x08	Access	Get	

Indicates that the drive is running in the reverse direction.

This attribute will be set to 1 when Pr 0.10.014 = 0 and Pr 0.10.002 = 1.

Ready

Name:	Ready			
Class	0x29	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x09	Access	Get	

The Ready attribute will be set in accordance with the state as shown in Table 9-38.

Table 9-38 Control Supervisor Ready attributes

Code	State	Ready state
3	Ready	True
4	Enabled	True
5	Stopping	True
	All others	False

Faulted

Name:	Faulted			
Class	0x29	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x0A	Access	Get	

Indicates that the drive is tripped, i.e. not OK (inverse of Pr 0.10.001).

Get 1 = Pr **0.10.001** = 0. Get 0 = Pr **0.10.001** = 1.

Safety information Product information Mechanical installation Electrical installation Getting started Basic parameters Running the motor Optimization NV Media Card Operation Onboard PLC Advanced parameters Diagnosti	UL information
--	-------------------

Warning

Name:	Warning		
Class	0x29	Default	N/A
Instance	0x01	Data Type	USINT
Attribute	0x0B	Access	Get

Indicates that one of the drive alarms is active.

Get Pr 0.10.019.

FaultRst

Name:	FaultRst			
Class	0x29	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x0C	Access	Get/Set	

Resets the drive from a tripped condition.

Sets Pr 0.10.038 to 100 on a 0 to 1 transition.

FaultCode

Name:	FaultCode		
Class	0x29	Default	N/A
Instance	0x01	Data Type	USINT
Attribute	0x0D	Access	Get

The fault code attribute will return the ODVA fault code as follows:

If the drive is not OK, the drive fault code is obtained from Pr **0.10.020**, if the drive fault code is listed in Table 9-39, then the ODVA fault code as shown in Table 9-39 below will be returned.

If the drive fault code is not listed in Table 9-39 then the Ethernet interface will return the ODVA code as follows:

ODVA Fault Code = 0x1000 + drive fault code.

Table 9-39 Control Supervisor fault code attributes

Drive Fault Code	ODVA Fault Code	Drive Fault Code	ODVA Fault Code
1	0x3220	20	0x2310
2	0x3210	21	0x4300
3	0x2300	26	0x5112
4	0x7112	32	0x3130
6	0x9000		

CtrlFromNet

Name:	CtrlFromNe	et		
Class	0x29	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x0F	Access	Get	

Indicates whether the drive is operating under fieldbus or terminal control.

This attribute will be set to 1 if Pr 0.06.042 (bit 7) = 1 and Pr 0.06.043 = 1 (fieldbus).

DriveEnable

Name:	DriveEnable)		
Class	0x29	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x66	Access	Get/Set	

Enables the drive. This puts the drive into the "Ready" state, allowing the **RunFwd** and **RunRev** attributes to control the drive. **RunFwd** and **RunRev** will have no effect if **DriveEnable** is not set to 1.

Get/Set Pr 0.06.042 bit 0.

NOTE The external hardware enable signal must also be present before the drive will enter the Ready state.

9.5.20 AC/DC Drive object

Class: 0x2A (42₁₀)

The AC/DC Drive object provides information on the drive running state and supports the following attributes:

Table 9-40 AC/DC Drive object attributes

Attribute ID	Name	Access	Par	ameter dependence	
0x03 (3 ₁₀)	AtReference	Get		Pr 0.10.006	
0x04 (4 ₁₀)	NetRef	Get/Set		Pr 0.06.042 (bit 8)	
0x06 (6 ₁₀)	DriveMode	Get/Set		(See Table 9-41 on page 134)	
0x07 (7 ₁₀)	SpeedActual	Get	RFC-A or RFC-S	Pr 0.03.002	
GXC1 (110)	opeed/total	001	Open Loop	Pr 0.05.004

0x08 (8 ₁₀)	B ₁₀) SpeedRef	Get	Open Loop	Pr 0.01.021 * 60 / NofPP (scaled to 0 decimal places)	
			Set	Open Loop	Pr 0.01.021 = SpeedRef * <i>NofPP /</i> 60 (scaled to 0 decimal places)
0x0B (11 ₁₀)	TorqueActual	Get		Pr 0.04.020 (scaled to 1 decimal place)	
0x0C (12 ₁₀)	TorqueRef	Get/Set		Pr 0.04.008 (scaled to 1 decimal place)	
0x1D (29 ₁₀)	RefFromNet		1	Pr 0.01.049 =3 AND Pr 0.01.050 =1	
0,10 (2010)	iten follinet	Get	0	Pr 0.01.049 <>3 OR Pr 0.01.050 <>1	

NOTE NofPP = Number of Pole Pairs.

AtReference

Name:	AtReferenc	e		
Class	0x2A	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x03	Access	Get	

Indicates that the drive is running at the requested speed.

Get Pr 0.10.006

0 = Drive not running at requested speed.

1 = Drive running at requested speed.

NetRef

Name:	NetRef		
Class	0x2A	Default	N/A
Instance	0x01	Data Type	USINT
Attribute	0x04	Access	Get/Set

Selects the source of the speed reference.

Get/Set Pr 0.06.042 bit 8

- 0 = analog speed reference.
 - 1 = digital speed reference.

NOTE The NetRef can only be changed between local and remote when the drive is configured in speed control mode. If a change is requested when in torque mode then a 'Device State Conflict' error code 0x10 will be returned.

	inf	Safety formation	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
--	-----	---------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	-------------------	--------------	---------------------	----------------------------	----------------	------------------------	-------------	-------------------

DriveMode

Name:	DriveMode		
Class	0x2A	Default	N/A
Instance	0x01	Data Type	USINT
Attribute	0x06	Access	Get/Set

DriveMode does not allow the operating mode of the drive to be changed. Pr **0.04.011** will be written to as shown in Table 9-41 below, provided that the drive is already in the correct operating mode.

Table 9-41 AC/DC Drive object DriveMode attribute (Get)

Access	Driv	veMode	Actual Drive	Torque Mode (0.4.011)
ALLESS	Value	Mode	Mode	
	1	Open Loop Speed	Open-loop	
	2	Closed Loop	RFC-A	Speed control mode (0)
	2	Speed	RFC-S	
	3 0 Us		Open-loop	
		Torque Control	RFC-A	Torque control (3)
Get			RFC-S	
			Regen	Don't care
		User Defined	Don't care	Torque control with speed override (2) or Coiler / uncoiler mode (3) or Speed control with torque feed- forward (4)

Table 9-42 AC/DC Drive object DriveMode attribute (Set)

Access	Driv	veMode	Actual Drive	Action
Access	Value	Mode	Mode	Action
	0	User Defined	Don't care	Return Invalid Attribute Value' (0x09)
			Open-loop	Pr 0.04.011 = Speed control mode (0)
	1	Open Loop Speed	RFC-A or RFC-S or Regen	Return 'Drive state conflict' error (0x10)
Set	2	Closed Loop	RFC-A or RFC-S	Pr 0.04.011 = Speed control mode (0)
		Speed	Open-loop or Regen	Return 'Drive state conflict' error (0x10)
	3	Torque Control	Open-loop or RFC-A or RFC-S	Pr 0.04.011 = Torque control mode (1)
			Regen	Return 'Drive state conflict' error (0x10)

NOTE Pr 0.11.031 will never be changed by setting the DriveMode attribute. An error (0x10) will be generated if the requested DriveMode value does not correspond to the current DriveType operating mode.

SpeedActual

Name:	SpeedActua	al		
Class	0x2A	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x07	Access	Get	

Returns the actual speed of the motor in RPM. The source of the motor speed depends on the operating mode of the drive.

Get Pr 0.05.004 (Open Loop).

Get Pr 0.03.002 (RFC-A or RFC-S).

SpeedRef

Name:	SpeedRef		
Class	0x2A	Default	N/A
Instance	0x01	Data Type	USINT
Attribute	0x08	Access	Get/Set

Sets or returns the speed reference in RPM.

RFC-A or RFC-S

Get/Set SpeedRef = Pr 0.01.021 (Scaled to 0 decimal places).

Open loop

Get SpeedRef = (Pr 0.01.021 * 60) / Pole Pairs (Scaled to 0 decimal places).

Set Pr **0.01.021** = (SpeedRef * Pole Pairs) / 60 (Scaled to 0 decimal places).

TorqueActual

Name:	TorqueActu	ial		
Class	0x2A	Default	N/A	
Instance	0x01	Data Type	USINT	
Attribute	0x0B	Access	Get	

Returns the actual load on the motor as a percentage of the rated motor load. This attribute has 1 decimal place precision, a value of 1000 represents 100.0 % load.

Get Pr 0.04.020 (Scaled to 1 decimal place).

TorqueRef

Name:			
Class	0x2A	Default	N/A
Instance	0x01	Data Type	USINT
Attribute	0x0C	Access	Get/Set

Sets the load (torque) reference as % of rated motor load (torque). This attribute has 1 decimal place precision, so a value of 1000 represents 100.0 % load.

Set Pr **0.04.008** = TorqueRef / 10 (Scaled to 1 decimal place). Get TorqueRef = Pr **0.04.008** * 10 (Scaled to 1 decimal place).

RefFromNet

Name:	RefFromNet	t		
Class	0x2A	Default		
Instance	0x01	Data Type	USINT	
Attribute	0x1D	Access	Get	

Indicates the source of the speed reference.

TRUE if Pr 0.01.049 = 3 and Pr 0.01.050 = 1.

FALSE otherwise.

9.5.21 Control Techniques objects

The Control Techniques objects (classes 0x64 to 0x69) allow access to all drive and option module parameters. The class instance number is used to reference the drive or option module menu number (except menu 0) and the class attribute number references the parameter within that menu.

Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	----------------------	--------------	---------------------	----------------------------	----------------	------------------------	-------------	-------------------

For example, the drive parameter Percentage Load (0.04.020) would be accessed as class 0x64, instance 0x04 and attribute 0x14.

An instance value of 0 is invalid therefore to allow access to menu 0 parameters, the instance value 200 (0xC8) must be used.

The number of instances and therefore the number of menus for each class depends on the destination device. If the drive is the destination then the number of menus will depend on the drive operating mode. If the destination is one of the option slots (or onboard Ethernet interface) then the number of menus depends on the type of option module fitted (or the onboard Ethernet interface).

Six individual classes are provided, the following table shows the classes used when accessing the drive or option module parameters.

Table 9-43 Control Techniques object classes

Class	Code		
Dec	Hex (0x)	Name	Description
100	64	CT Group	Provides access to all drive parameters
101	65	CT This Slot	Provides access to the connected Ethernet interface parameters
102	66		Provides access to the option module in slot 1 parameters
103	67		Provides access to the option module in slot 2 parameters
104	68		Provides access to the option module in slot 3 parameters
105	69	CT Slot 4	Provides access to the onboard Ethernet interface parameters

Profinet IO specification 9.6 (Unidrive M700 / M702)

9.6.1 What is **PROFINET**?

PROFINET is an Ethernet based industrial network protocol adapting Ethernet hardware and protocols to the real time needs of industrial automation. Profinet enables distributed IO control from a PLC.

962 Features / Specification

- Dual 100 BASE-TX RJ45 connectors with support for shielded twisted pair, full-duplex 100 M bps connectivity with auto crossover correction
- Both RJ45 ports operate in full duplex mode as a network switch
- PROFINET Real Time class RT_Class_1 and conformance class A
- Cycle times from 1 ms to 512 ms specified during configuration
- Automatic device replacement using the LLDP protocols •
- LED indication of network port activity
- Up to 64 cyclic IO module slots (maximum 32 inputs and 32 outputs configured by network configuration tool and GSDML file)
- Identification and Maintenance functions I&M0 to I&M4 supported

When referring to the cyclic data, the terms input and output NOTE are with respect to the PROFINET IO controller (PLC).

The terms 'network controller' and 'PLC' are mutually used in NOTE this manual to refer to the PROFINET network controller. This is generally a PLC with a PROFINET interface and possibly a programming interface to connect to the programming device or PC. However this interface is not necessary, as the PROFINET interface can be used to program the PLC.

9.6.3 **GSDML** Files

A GSDML (General Station Description Markup Language) file is required to describe the drive interface to a PROFINET controller or PLC. This is an XML file, the structure of which is specified by the PROFIBUS INTERNATIONAL organization (www.profibus.org).

The GSDML file is used in conjunction with the network configuration software to configure the Profinet interface for cyclic data exchange. Many commonly used drive parameters are available as direct mapping 'modules' to be added to the cyclic data 'slots'.

Non-specific 'Flexible modules' are also provided so that the user can allocate a parameter within the drive (or option module), that is not directly available as a specific 'module'. These options will be available from a drop-down selection list within the 'Parameters' tab of the 'module' properties.

The GSDML file can be downloaded from the main Control Techniques company website (www.controltechniques.com), providing you are registered or, alternatively, requested from your local Drive Centre or supplier.

NOTE For further information regarding the use of the GSDML file please refer to the PLC documentation

9.6.4 Network topology

The Ethernet interface has two Ethernet ports with integrated switches to allow the use of line networks. However, when using line networks, a break in the connection (for example when replacing a device) will cause all devices downstream from the failure to also stop communicating with the controller.

Other Ethernet network topologies can be used but care must be taken to ensure that the system still operates within the constraints specified by the designer.

Generally a star or tree network structure using switches gives improved availability in the event of a device failure or replacement.

	T	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
--	---	-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	----------------------	--------------	---------------------	----------------------------	----------------	------------------------	-------------	-------------------

Although the Profinet protocol does support all major topologies, line networks are normally used for practical or financial reasons, other topologies (e.g. star) may not be suitable for real time communications due to their inherent use of switches or other network equipment.

Any network devices used, such as switches, must be capable of real time communication. Standard office grade equipment is not normally suitable and should not be used in an industrial environment.

NOTE For the device replacement feature to work, the physical network topology must be configured in the controller. For further information please refer to the controller or network configuration software documentation.

9.6.5 Configuring the PROFINET IO communications

No module parameters need to be configured by the user in order to achieve PROFINET cyclic communications. All the necessary configuration is undertaken by the network controller or PLC during the start-up sequence, and after the network configuration is programmed into the network controller or PLC.

It must be noted that when configuring the cyclic data modules, if a module is configured but the associated drive parameter does not actually exist in the drive, then the PLC will not start up correctly and will indicate a configuration fault.

Parameters of slot option module menus can also be configured for cyclic data communication via correctly configured 'Flexible Modules'. The source of the associated parameter can be set to drive or any possible slot within the 'Flexible Module' parameter properties.

9.6.6 Setting the Profinet device name

Each Profinet device must have it's own unique device name assigned during network configuration. Device names are used by the controller to communicate with the device for real time messages and alarms. Without a device name the device will not enter data exchange with the controller.

The actual device name is not important to the Profinet system itself, however, a suitable name should be chosen so that it is easily recognised on the network and identifies the location and function of the device.

A typical device name may contain up to four labels, each label is separated by a dot (.) and may be up to 63 characters in length.

The following rules must be observed when choosing the device name:

- Maximum length of 127 characters
- Characters must be lower case letters, numbers, dashes (-) or dots (.)
- The device name must start with a letter and end with either a letter or number
- The device name must not be in the format n.n.n.n (where n is a number from 0 to 999)
- The device name must not begin with the character sequence 'portxyz (where x, y and z are numbers from 0 to 9).

A typical example of a device name may be:

motor-1.conveyor-2.line-3.ct-4

The default device name is specified in the GSDML file under the section 'DNS_CompatibleName'.

9.6.7 Profinet transmission cycle (send cycle)

The Profinet transmission cycle is the time required to update all the devices on the Profinet network, the duration of the transmission cycle is determined by the Profinet device with the slowest update rate.

The transmission cycle can be split into a number of phases, where each phase contains one or more devices with similar update rates, the duration of each phase will be equal to the fastest update rate.

Base clock

The base clock is the minimum time unit used and is equal to 31.25 $\mu s.$

Send clock factor

The send clock factor determines the duration of each phase and is the number of base clock periods within each phase.

The following table illustrates the relationship between the supported send clock values and the phase duration.

Send Clock Factor	Phase Duration (ms)
32	1
64	2
128	4

Phase duration

The duration (or length) of each phase is determined by the formula:

Phase duration = Send clock factor x Base clock.

Reduction ratio

The reduction ratio acts as a multiplier of the minimum update time (or phase duration) and is determined for each device by the formula:

Reduction ratio = Device update time / Phase duration

Number of phases

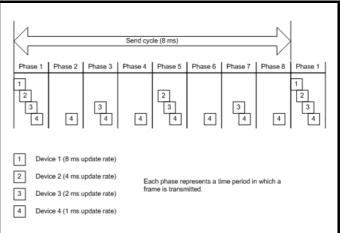

The number of phases is determined by the formula:

Number of phases = Send cycle / fastest update rate.

Example:

In the following example, a system uses four devices, device 1 has an update rate of 8 ms, device 2 has an update rate of 4 ms, device 3 has an update rate of 2 ms and device 4 has an update rate of 1 ms.

Figure 9-5 Profinet transmission cycle

The Profinet transmission cycle is effectively the slowest update rate (8 ms in this example), and the phase duration is effectively the quickest update rate (1 ms in this example).

= $32 \times 31.25 \ \mu s = 1 \ ms$ Reduction ratio = Device update time / Phase duration Reduction ratio _(device1) = $8 \ ms / 1 \ ms = 8$
Reduction ratio $_{(device 1)}$ = 8 ms / 1 ms = 8
Reduction ratio (device2) = 4 ms / 1 ms = 4
Reduction ratio (device3) = 2 ms / 1 ms = 2

Reduction ratio (device4) = 1 ms / 1 ms = 1

Number of phases = Send cycle / fastest update rate = 8 ms / 1 ms = 8

9.6.8 Update rates

In contrast to some other fieldbus networks, Profinet devices can be configured with different update rates, these rates are specified in the device GSDML file. The Profinet interface on the M700 and M702 supports update rates of 1, 2, 4, 8, 16, 32, 64, 128, 256 and 512 ms.

Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	-------------------	--------------	------------------------	----------------------------	----------------	------------------------	-------------	-------------------

It is recommended that to avoid the possibility of overloading any sections of the Profinet network, the slowest update rate necessary is used.

The update rate can be configured in one of three ways:

- · Automatic the update rate selected is the time calculated by the I/
- O system that can be reliably achieved, based on the configuration. • Fixed update time – the update rate is selected by the user from a
- list of supported rates specified in the GSDML file
 Fixed factor the update rate is selected by the user from a list of supported rates specified in the GSDML file
- NOTE This information only applies to the Siemens I/O configuration system (TIA Portal/SIMATIC STEP7), other I/O configuration systems may provide different configuration options.

9.6.9 Link Layer Discovery Protocol (LLDP)

LLDP is a manufacturer independent layer 2 protocol defined in accordance with the IEEE802.1AB standard.

During start-up and at regular intervals, LLDP messages are used to transfer device information between neighbouring devices. This information includes the device name and connection port numbers. LLDP messages use a special multicast destination MAC address that the IEEE802.1D compliant bridges and switches should not forward.

If all devices in a network support LLDP messages then an accurate network topology view can be presented in the I/O system configuration / diagnostic tool.

9.6.10 Discovery and Configuration Protocol (DCP)

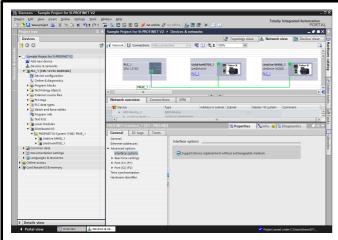

The Discovery and Configuration Protocol is used in the event of a device replacement to automatically configure the new device. All the necessary configuration is done by an appropriate neighbouring device when the new device is detected.

In order to use the network discovery and configuration protocol, the PLC must be correctly configured and programmed with the physical network topology, the following information is intended as a guide only, for more specific information (in particular for other types of PLC's), then please consult the PLC documentation.

NOTE Although the Siemens PLC is mentioned in this manual, Control Techniques does not recommend or endorse any particular PLC or controller manufacturer.

The following information relates to the Siemens S7-1215C PLC. The PLC must be configured to support device replacement, this is an option in the properties of the PROFINET port. In the device configuration screen of the TIA PORTAL application, open the properties of the PLC PROFINET port, click 'Interface options' under 'Advanced options' as shown in Figure 9-6. Ensure the option 'Support device replacement without exchangeable medium' is selected.

Figure 9-6 PLC device replacement option

The network topology must now be configured. From the hardware configuration screen, select the port, right click it and select 'PROFINET IO Topology...', the topology editor will be displayed, select the 'Graphic view' tab and using 'drag and drop', connect the relevant device ports together to match the physical network wiring. The program must then be compiled and downloaded to the PLC in the normal manner. Once the PLC has been configured, if a device is replaced then the new device will be automatically configured with the original device's properties, including the device name and IP address.

NOTE For the discovery protocol to work, the replacement device must not have a device name programmed, i.e. it must be blank or unused. If a device name exists in the module and that name is different to the device name set in the network configuration then the PLC will indicate a configuration error and will not enter data exchange with it.

9.6.11 Identification and Maintenance (I&M)

Identification and Maintenance (I&M) functions can be used to read and change various information about devices, such as manufacturer, ordering information, serial number, etc. This information can be used to assist the user in tracking the drive's life cycle through commissioning/ start-up, parameterization, diagnosis, repair, etc. The Ethernet interface supports I&M0 to I&M4 inclusively; I&M0 is mandatory for all PROFINET devices, I&M1 to I&M4 are optional. Each I&M function returns specific information about the device and is explained in the following tables.

I&M0

Table 9-44 I&M0 Description

Attribute	Value (Read only)
Manufacturer ID	0x0160
Order ID	SI-PROFINET
Serial number	(Pr S.00.005 x 1,000,000,000 + Pr S.00.004)
Hardware revision	(Pr S.00.003)
Software revision	(Pr S.00.002)
Revision counter	(Pr S.24.006)
Profile ID	(as read)
Profile specific type	(as read)
I&M version	(as read)
I&M supported	(as read)

Manufacturer ID: 2-byte unsigned hexadecimal number assigned by the PROFIBUS business office and specified in the GSDML file. For Control Techniques this value is 0x0160.

Order ID: 20-byte string to identify the device. This value is specified in the GSDML file. For the Ethernet interface this value is 'SI-PROFINET'.

Serial number: 16 character string indicating the module serial number. This value is read from Pr **S.00.004** and Pr **S.00.005** of the Ethernet interface.

Hardware revision: 2-byte unsigned hexadecimal number indicating the hardware revision of the Ethernet interface.

This value is read from Pr S.00.003 of the Ethernet interface.

Software revision: 4-byte value consisting of a single character 'V' and 3 unsigned 8-bit decimal numbers indicating the software revision of the Ethernet interface.

This value is taken from Pr S.00.002 of the Ethernet interface.

Revision counter: 2-byte unsigned decimal number.

This value will increment by one for each of the following conditions:

- > Drive parameter save
- > Drive parameter default
- > Drive mode change

Will wrap back to 1 after a value of 65535.

Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information
					P				• • • • • • • • • • • • • • • • • • • •	. = 0	P		

Profile ID: 2-byte unsigned hexadecimal number indicating the application profile.

Devices not following any particular profile use the generic profile value 0xF600.

Profile specific type: 2-byte unsigned hexadecimal number indicating the application profile specific type. This value is not applicable to devices using the generic profile and in these instances this value will be zero.

I&M version: 2 unsigned 8-bit numbers indicating the version of the implemented I&M functions.

I&M supported: 2-byte unsigned number indicating the availability of the implemented I&M functions as shown in Table 9-45.

Table 9-45 Supported I&M bit descriptions

Bit	Value	Description
0		Profile specific I&M
1	0	I&M1 Not supported
'	1	I&M1 Supported
2	0	I&M2 Not supported
2	1	I&M2 Supported
3	0	I&M3 Not supported
3	1	I&M3 Supported
1	0	I&M4 Not supported
-	1	I&M4 Supported
5 to 15		Reserved

I&M1

Table 9-46 I&M1 Description

Attribute	Value (Read/Write)
Drive function (32 bytes)	(User defined)
Drive location (22 bytes)	(User defined)

Drive function: 32-byte string indicating the drive function. **Drive location**: 22-byte string indicating the drive location.

I&M2

Table 9-47 I&M2 Description

Attribute	Value (Read/Write)
Installation date	(User defined)

Installation date: 16-byte string indicating the installation or commissioning date of the device. The installation date is in the format DD/MM/YYYY.

I&M3

Table 9-48 I&M3 Description

Attribute	Value (Read/Write)
Descriptor (54 bytes)	(User defined)

Descriptor: 54-byte string used to store additional information on the location, function or maintenance status of the device.

I&M4

Table 9-49 I&M4 Description

Attribute	Value (Read/Write)
Signature (54 bytes)	(User defined)

Signature: 54-byte octet string used to allow parameterization tools to store a security code as a reference for a particular parameterization session and audit trail tools to retrieve the code for integrity checks.

NOTE

All unused bytes of the I&M functions will be set to 0x20 (space).

NV Media Card Operation 10

10.1 Introduction

The Non-Volatile Media Card feature enables simple configuration of parameters, parameter back-up, storing / reading PLC programs and drive copying using a SMARTCARD or SD card storing / reading PLC programs. The drive offers backward compatibility for a Unidrive SP SMARTCARD and supports NV Media Cards formatted with either FAT16 or FAT32 file system.

The NV Media Card can be used for:

- Parameter copying between drives
- Saving drive parameter sets
- Saving an onboard user program

The NV Media Card is located at the top of the module under the drive display (if installed) on the left-hand side.

Ensure the NV Media Card is inserted with the contacts facing the lefthand side of the drive.

The drive only communicates with the NV Media Card when commanded to read or write, meaning the card may be "hot swapped".

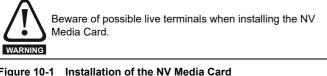

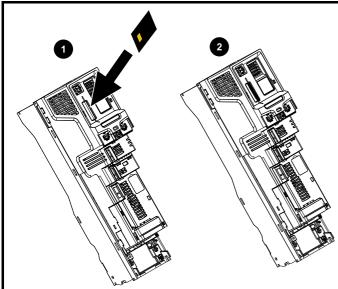

Figure 10-1 Installation of the NV Media Card

- Installing the NV Media Card 1
- NV Media Card installed 2.

NV Media Card	Part number
SD Card Adaptor (memory card not included)	82400000016400
8 kB SMARTCARD	2214-4246-03
64 kB SMARTCARD	2214-1006-03

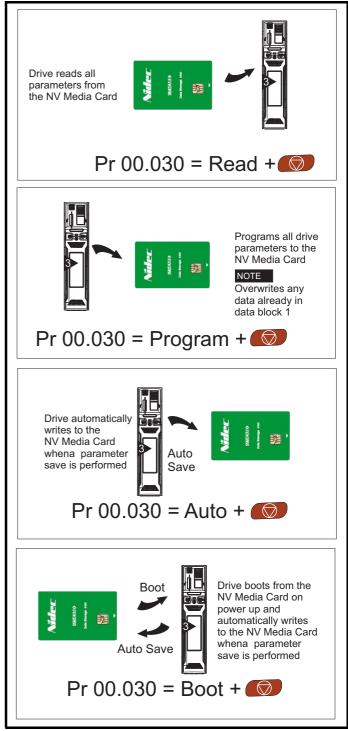

10.2 NV Media Card support

The NV Media Card can be used to store drive parameter sets and / or PLC programs set from the Unidrive M in data blocks 001 to 499 on the card

The Unidrive M is compatible with a Unidrive SP SMARTCARD and is able to read and translate the Unidrive SP parameter set into a compatible parameter set for Unidrive M. This is only possible if the Unidrive SP parameter set was transferred to the SMARTCARD using the difference from defaults transfer method (i.e. 4yyy transfer). The Unidrive M is not able to read any other type of Unidrive SP data block on the card. Although it is possible to transfer difference from default data blocks from a Unidrive SP into the Unidrive M, the following should be noted:

- 1. If a parameter from the source drive does not exist in the target drive then no data is transferred for that parameter.
- If the data for the parameter in the target drive is out of range then the data is limited to the range of the target parameter.
- 3. If the target drive has a different rating to the source drive then the normal rules for this type of transfer apply.

Figure 10-2 Basic NV Media Card operation

									_				
Safet	y Product	Mechanical	Electrical	Getting	Basic	Running	Ontimization	Drive	NV Media Card	Onboard	Advanced	Diagnostics	UL
informa	ion informatio	installation	installation	started	parameters	the motor	Optimization	communication	Operation	PLC	parameters	Diagnostics	information

The whole card may be protected from writing or erasing by setting the read-only flag as detailed section 10.3.9 9888 / 9777 - Setting and clearing the NV Media Card read only flag on page 141.

The card should not be removed during data transfer, as the drive will produce a trip. If this occurs then either the transfer should be reattempted or in the case of a card to drive transfer, default parameters should be loaded.

10.3 Transferring data

Data transfer, erasing and protecting the information is performed by entering a code in Pr **mm.000** and then resetting the drive as shown in Table 10-1.

Table 10-1 SMARTCARD and SD card co	des
-------------------------------------	-----

Code	Operation	SMARTCARD	SD card
2001	Transfer the drive parameters to parameter file 001 and sets the block as bootable. This will include the parameters from attached option modules.	\checkmark	✓
4ууу	Transfer the drive parameters to parameter file yyy. This will include the parameters from attached option modules.	~	~
5ууу	Transfer the onboard user program to onboard user program file yyy.	~	✓
бууу	Load the drive parameters from parameter file yyy or the onboard user program from onboard user program file yyy.	~	~
7ууу	Erase file yyy.	\checkmark	√
8ууу	Compare the data in the drive with file yyy. If the files are the same then <i>Pr mm.000</i> (mm.000) is simply reset to 0 when the compare is complete. If the files are different a 'Card Compare' trip is initiated. All other NV media card trips also apply.	√	~
9555	Clear the warning suppression flag	\checkmark	√
9666	Set the warning suppression flag	~	√
9777	Clear the read-only flag	~	✓
9888	Set the read-only flag	~	✓
9999	Erase and format the NV media card	~	

Where yyy indicates the block number 001 to 999.

NOTE

If the read only flag is set then only codes 6yyy or 9777 are effective.

10.3.1 Writing to the NV Media Card

4yyy - Writes defaults differences to the NV Media Card The data block only contains the parameter differences from the last time default settings were loaded.

All parameters except those with the NC (Not copied) coding bit set are transferred to the NV Media Card. In addition to these parameters all menu 20 parameters (except Pr **20.000**), can be transferred to the NV Media Card.

Writing a parameter set to the NV Media Card (Pr 00.030 = Program (2))

Setting Pr **00.030** to Program (2) and resetting the drive will save the parameters to the NV Media Card, i.e. this is equivalent to writing 4001 to Pr **mm.000**. All NV Media Card trips apply except 'Card Change'. If the data block already exists it is automatically overwritten. When the action is complete this parameter is automatically reset to None (0).

10.3.2 Reading from the NV Media Card 6yyy - Reading from NV Media Card

When the data is transferred back to the drive, using 6yyy in Pr **mm.000**, it is transferred to the drive RAM and the EEPROM. A parameter save is not required to retain the data after-power down. Set up data for any option modules installed stored on the card are transferred to the drive. If the option modules installed are different between source and destination drives, the menus for the option module slots where the option module categories are different are not updated from the card and will contain their default values after the copying action. The drive will produce a 'Card Option' trip if the option module installed to the source and the destination drives are different or are in different slots. If the data is being transferred to the drive with different voltage or current rating a 'Card Rating' trip will occur.

The following drive rating dependant parameters (RA coding bit set) will not be transferred to the destination drive by a NV Media Card when the

voltage rating of the destination drive is different from the source drive and the file is a parameter file.

However, drive rating dependent parameters will be transferred if only the current rating is different. If drive rating dependant parameters are not transferred to the destination drive they will contain their default values.

- Pr 06.065 Standard Under Voltage Threshold
- Pr 06.066 Low Under Voltage Threshold
- Pr 06.073 Braking IGBT Lower Threshold
- Pr 06.074 Braking IGBT Upper Threshold

Pr 06.075 Low Voltage Braking IGBT Threshold

Reading a parameter set from the NV Media Card (Pr 00.030 = Read (1))

Setting Pr **00.030** to Read (1) and resetting the drive will transfer the parameters from the card into the drive parameter set and the drive EEPROM, i.e. this is equivalent to writing 6001 to Pr **mm.000**.

All NV Media Card trips apply. Once the parameters are successfully copied this parameter is automatically reset to None (0). Parameters are saved to the drive EEPROM after this action is complete.

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	Drive	NV Media Card		Advanced	Diagnostics	UL
information	information	installation	installation	started	parameters	the motor	Opumization	communication	Operation	PLC	parameters	Diagnostics	information

10.3.3 Auto saving parameter changes (Pr 00.030 = Auto (3))

This setting causes the drive to automatically save any changes made to menu 0 parameters on the drive to the NV Media Card. The latest menu 0 parameter set in the drive is therefore always backed up on the NV Media Card. Changing Pr **00.030** to Auto (3) and resetting the drive will immediately save the complete parameter set from the drive to the card, i.e. all parameters except parameters with the NC coding bit set. Once the whole parameter set is stored only the individual modified menu 0 parameter setting is updated.

Advanced parameter changes are only saved to the NV Media Card when Pr **mm.000** is set to 'Save Parameters' or a 1001 and the drive reset.

All NV Media Card trips apply, except 'Card Change'. If the data block already contains information it is automatically overwritten.

If the card is removed when Pr 00.030 is set to 3 Pr 00.030 is then automatically set to None (0).

When a new NV Media Card is installed Pr **00.030** must be set back to Auto (3) by the user and the drive reset so the complete parameter set is rewritten to the new NV Media Card if auto mode is still required.

When Pr **00.030** is set to Auto (3) and the parameters in the drive are saved, the NV Media Card is also updated, and therefore the NV Media Card becomes a copy of the drives stored configuration.

At power up, if Pr **00.030** is set to Auto (3), the drive will save the complete parameter set to the NV Media Card. The drive will display 'Card Write' during this operation. This is done to ensure that if a user puts a new NV Media Card in during power down the new NV Media Card will have the correct data.

NOTE

When Pr **00.030** is set to Auto (3) the setting of Pr **00.030** itself is saved to the drive EEPROM but not the NV Media Card.

10.3.4 Booting up from the NV Media Card on every power up (Pr 00.030 = Boot (4))

When Pr **00.030** is set to Boot (4) the drive operates the same as Auto mode except when the drive is powered-up. The parameters on the NV Media Card will be automatically transferred to the drive at power up if the following are true:

- A card is inserted in the drive
- Parameter data block 1 exists on the card
- The data in block 1 is type 1 to 4 (as defined in Pr **11.038**)
- Pr **00.030** on the card set to Boot (4)

The drive will display 'Booting Parameters during this operation. If the drive mode is different from that on the card, the drive gives a 'Card Drive Mode' trip and the data is not transferred.

If 'Boot' mode is stored on the copying NV Media Card this makes the copying NV Media Card the master device. This provides a very fast and efficient way of re-programming a number of drives.

NOTE

[']Boot' mode is saved to the card, but when the card is read, the value of Pr **00.030** is not transferred to the drive.

10.3.5 Booting up from the NV Media Card on every power up (Pr mm.000 = 2001)

It is possible to create a bootable parameter data block by setting Pr **mm.000** to 2001 and initiating a drive reset. This data block is created in one operation and is not updated when further parameter changes are made.

Setting Pr **mm.000** to 2001 will overwrite the data block 1 on the card if it already exists.

10.3.6 8yyy - Comparing the drive full parameter set with the NV Media Card values

Setting 8yyy in Pr **mm.000**, will compare the NV Media Card file with the data in the drive. If the compare is successful Pr **mm.000** is simply set to 0. If the compare fails a 'Card Compare' trip is initiated.

10.3.7 7yyy / 9999 - Erasing data from the NV Media Card values

Data can be erased from the NV Media Card either one block at a time or all blocks in one go.

- Setting 7yyy in Pr mm.000 will erase NV Media Card data block yyy
- Setting 9999 in Pr mm.000 will erase all data blocks on a SMARTCARD, but not on a SD Card.

10.3.8 9666 / 9555 - Setting and clearing the NV Media Card warning suppression flag

If the option modules installed to the source and destination drive are different or are in different slots the drive will produce a 'Card Option' trip. If the data is being transferred to a drive of a different voltage or current rating a 'Card Rating' trip will occur. It is possible to suppress these trips by setting the warning suppression flag. If this flag is set the drive will not trip if the option module(s) or drive ratings are different between the source and destination drives. The options module or rating dependent parameters will not be transferred.

- Setting 9666 in Pr mm.000 will set the warning suppression flag
- Setting 9555 in Pr mm.000 will clear the warning suppression flag

10.3.9 9888 / 9777 - Setting and clearing the NV Media Card read only flag

The NV Media Card may be protected from writing or erasing by setting the read only flag. If an attempt is made to write or erase a data block when the read only flag is set, a 'Card Read Only' trip is initiated. When the read only flag is set only codes 6yyy or 9777 are effective.

- Setting 9888 in Pr mm.000 will set the read only flag
- Setting 9777 in Pr mm.000 will clear the read only flag

10.4 Data block header information

Each data block stored on a NV Media Card has header information detailing the following:

- NV Media Card File Number (11.037)
- NV Media Card File Type (11.038)
- NV Media Card File Version (11.039)
- NV Media Card File Checksum (11.040)

The header information for each data block which has been used can be viewed in Pr **11.038** to Pr **11.040** by increasing or decreasing the data block number set in Pr **11.037**. If there is no data on the card Pr **11.037** can only have a value of 0.

10.5 NV Media Card parameters

Table 10-2 Key to parameter table coding

			•
RW	Read / Write	ND	No default value

The value of *NV Media Card File Required Version* (11.077) is used as the version number for a file when it is created on an NV Media Card. *NV Media Card File Required Version* (11.077) is reset to 0 when the file is created or the transfer fails.

10.6 NV Media Card trips

After an attempt to read, write or erase data from a NV Media Card a trip is initiated if there has been a problem with the command.

See Chapter 13 *Diagnostics* on page 245 for more information on NV Media Card trips.

11 Onboard PLC

11.1 Onboard PLC and Machine Control Studio

The drive has the ability to store and execute a 16 kB Onboard PLC user program without the need for additional hardware in the form of an option module.

Machine Control Studio is an IEC61131-3 development environment designed for use with Unidrive M and compatible application modules. Machine Control Studio is based on CODESYS from 3S-Smart Software Solutions.

All of the programming languages defined in the IEC standard IEC 61131-3 are supported in the Machine Control Studio development environment.

- ST (Structured text)
- LD (Ladder diagram)
- FBD (Function block diagram)
- IL (Instruction list)
- SFC (Sequential function chart)
- CFC (Continuous Function Chart). CFC is an extension to the standard IEC programming languages

Machine Control Studio provides a complete environment for the development of user programs. Programs can be created, compiled and downloaded to a Unidrive M for execution, via the communications port on the front of the drive. The run-time operation of the compiled program on the target can also be monitored using Machine Control Studio and facilities are provided to interact with the program on the target by setting new values for target variables and parameters.

The Onboard PLC and Machine Control Studio form the first level of functionality in a range of programmable options for Unidrive M.

Machine Control Studio can be downloaded from www.controltechniques.com.

See the Machine Control Studio help file for more information regarding using Machine Control Studio, creating user programs and downloading user programs to the drive.

11.2 Benefits

The combination of the Onboard PLC and Machine Control Studio, means that the drive can replace nano and some micro PLCs in many applications

Machine Control Studio benefits from access to the standard CODESYS function and function block libraries as well as those from third parties. Functions and function blocks available as standard in Machine Control Studio include, but not limited to, the following:

- Arithmetic blocks
- Comparison blocks
- Timers
- Counters
- Multiplexers
- Latches
- Bit manipulation

Typical applications for the Onboard PLC include:

- Ancillary pumps
- Fans and control valves
- Interlocking logic
- Sequences routines
- Custom control words.

11.3 Features

The Unidrive M Onboard PLC user program has the following features:

11.3.1 Tasks

The Onboard PLC allows use of two tasks.

- Clock: A high priority real time task. The clock task interval can be set from 4 ms to 262 s in multiples of 4 ms. The parameter *Onboard User Program: Clock Task Time Used* (11.051) shows the percentage of the available time used by clock task. A read or write of a drive parameter by the user program takes a finite period of time. It is possible to select up to 10 parameters as fast access parameter which reduced the amount of time it takes for the user program to read from or write to a drive parameter. This is useful when using a clock task with a fast update rate as selecting a parameter for fast access parameters.
- Freewheeling: A non-real time background task. The freewheeling task is scheduled for a short period once every 64 ms. The time for which the task is scheduled will vary depending on the loading of the drive's processor. When scheduled, several scans of the user program may be performed. Some scans may execute in microseconds. However, when the main drive functions are scheduled there will be a pause in the execution of the program causing some scans to take many milliseconds. The parameter *Onboard User Program: Freewheeling Tasks Per Second* (11.050) shows the number of times the freewheeling task has started per second.

11.3.2 Variables

The Onboard PLC supports the use of variables with the data types of Boolean, integer (8 bit, 16 bit and 32 bit, signed and unsigned), floating point (64 bit only), strings and time.

11.3.3 Custom menu

Machine Control Studio can construct a custom drive menu to reside in menu 30 on the drive. The following properties of each parameter can be defined using Machine Control Studio:

- Parameter name
- Number of decimal places
- The units for the parameter to be display on the keypad.
- The minimum, maximum and default values
- Memory handling (i.e. power down save, user save or volatile)
- Data type. The drive provides a limited set of 1 bit, 8 bit, 16 bit and 32 bit integer parameters to create the customer menu.

Parameters in this customer menu can be accessed by the user program and will appear on the keypad.

11.3.4 Limitations

The Onboard PLC user program has the following limitations:

- The flash memory allocated to the Onboard PLC is 16 kB which includes the user program and its header which results in a maximum user program size of about 12 kB
- The Onboard PLC is provided with 2 kB of RAM.
- The drive is rated for 100 program downloads. This limitation is imposed by the flash memory used to store the program within the drive.
- There is only one real-time task with a minimum period of 4 ms.
- The freewheeling background task runs at a low priority. The drive is
 prioritized to perform the clock task and its major functions first, e.g.
 motor control, and will use any remaining processing time to execute
 the freewheeling task as a background activity. As the drive's
 processor becomes more heavily loaded, less time is spent
 executing the freewheeling task.
- Breakpoints, single stepping and online program changes are not possible.
- The Graphing tool is not supported.
- The variable data types REAL (32 bit floating point), LWORD (64 bit integer) and WSTRING (Unicode string), and retained variables are not supported.

11.4 Onboard PLC parameters

The following parameters are associated with the Onboard PLC user program.

11.	047	Onboard	l User Pro	ogram: Er	nable	
RW	Txt				US	
ţ	Stop	(0) or Ru	n (1)	₽	Rur	า (1)

This parameter stops and starts the user program.

0 - Stop the User Program

The onboard user program is stopped. If it is restarted by setting *Onboard User Program: Enable* (11.047) to a non-zero value the background task starts from the beginning.

1 - Run the User Program

The user program will execute.

11.	048	Onboard	l User Pro	ogram: St	atus	
RO	Txt		NC	PT		
Û		47483648 14748364		⇔		

This parameter is read-only and indicates the status of the user program in the drive. The user program writes the value to this parameter.

- 0: Stopped
- 1: Running
- 2: Exception

3: No user program present

11.	049	Onboard	l User Pro	ogram: Pr	ogramming	g Events
RO	Uni		NC	PT	PS	
\Im	(0 to 65535	5	⇒		

This parameter holds the number of times an Onboard PLC user program download has taken place and is 0 on dispatch from the factory. The drive is rated for one hundred program downloads. This parameter is not altered when defaults are loaded.

11.050		Onboard User Program: Freewheeling Tasks Per Second					
RO	Uni		NC	PT			
ţ	0 to 65535			₽			

This parameter shows the number of times the freewheeling task has started per second.

11.051		Onboard User Program: Clock Task Time Used					
RO			NC	PT			
ţ	0.0 to 100.0 %			⇒			

This parameter shows the percentage of the available time used by the user program clock task.

11.055		Onboard User Program: Clock Task Scheduled Interval					
RO			NC	PT			
ţ	0 to 262128 ms			⇒			

This parameter shows the interval at which the clock task is scheduled to run at in ms.

11.5 Onboard PLC trips

If the drive detects an error in the user program it will initiate a User Program trip. The sub-trip number for the User Program trip details the reason for the error. See Chapter 13 *Diagnostics* on page 245 for more information on the User Program trip.

12 Advanced parameters

This is a quick reference to all parameters in the drive showing units, ranges limits etc, with block diagrams to illustrate their function. Full descriptions of the parameters can be found in the *Parameter Reference Guide*.

These advanced parameters are listed for reference purposes only. The lists in this chapter do not include sufficient information for adjusting these parameters. Incorrect adjustment can affect the safety of the system, and damage the drive and or external equipment. Before attempting to adjust any of these parameters, refer to the *Parameter Reference Guide*.

Operation mode abbreviations:

Open-loop: Sensorless control for induction motors

RFC-A: Asynchronous Rotor Flux Control for induction motors

RFC-S: Synchronous Rotor Flux Control for synchronous motors including permanent magnet motors.

Default abbreviations:

Standard default value (50 Hz AC supply frequency)

USA default value (60 Hz AC supply frequency)

NOTE

Parameter numbers shown in brackets $\{...\}$ are the equivalent Menu 0 parameters. Some Menu 0 parameters appear twice since their function depends on the operating mode.

The Range - RFC-A / S column applies to both RFC-A and RFC-S. For some parameters, this column applies to only one of these modes, this is indicated accordingly in the Default columns.

In some cases, the function or range of a parameter is affected by the setting of another parameter. The information in the lists relates to the default condition of any parameters affected in this way.

Table 12-2 Key to parameter table coding

	Key to parameter table coding
Coding	Attribute
RW	Read/Write: can be written by the user
RO	Read only: can only be read by the user
Bit	1 bit parameter. 'On' or 'Off' on the display
Num	Number: can be uni-polar or bi-polar
Txt	Text: the parameter uses text strings instead of numbers.
Bin	Binary parameter
IP	IP Address parameter
Мас	Mac Address parameter
Date	Date parameter
Time	Time parameter
Chr	Character parameter
FI	Filtered: some parameters which can have rapidly changing values are filtered when displayed on the drive keypad for easy viewing.
DE	Destination: This parameter selects the destination of an input or logic function.
RA	Rating dependent: this parameter is likely to have different values and ranges with drives of different voltage and current ratings. Parameters with this attribute will be transferred to the destination drive by non-volatile storage media when the rating of the destination drive is different from the source drive and the file is a parameter file. However, the values will be transferred if only the current rating is different and the file is a difference from default type file.
ND	No default: The parameter is not modified when defaults are loaded
NC	Not copied: not transferred to or from non-volatile media during copying.
PT	Protected: cannot be used as a destination.
US	User save: parameter saved in drive EEPROM when the user initiates a parameter save.
PS	Power-down save: parameter automatically saved in drive EEPROM when the under volts (UV) state occurs.

* Only displayed on *Unidrive M700 / M702*.

** Only displayed when the option modules are installed.

12.1 Parameter ranges and Variable minimum/maximums

Some parameters in the drive have a variable range with a variable minimum and a variable maximum value which is dependent on one of the following:

- The settings of other parameters
- The drive rating
- The drive mode
- Combination of any of the above

The tables below give the definition of variable minimum/maximum and the maximum range of these.

VM_AC_V	OLTAGE	Range applied to parameters showing AC voltage
Units	V	
Range of [MIN]	0	
Range of [MAX]	0 to 930	
Definition	VM_AC_VOLTAGE[MAX] is	s drive voltage rating dependent. See Table 12-4
Demnition	VM_AC_VOLTAGE[MIN] =	0

VM_AC_VO	TAGE_SET Range applied to the AC voltage set-up parameters
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 690
Definition	VM_AC_VOLTAGE[MAX] is drive voltage rating dependent. See Table 12-4
Deminion	VM_AC_VOLTAGE[MIN] = 0

VM_A	ACCEL_RATE Maximum applied to the ramp rate parameters
Units	s / 100 Hz, s / 1000 rpm, s / 1000 mm/s
Range of [MIN]	Open-loop: 0.0 RFC-A, RFC-S: 0.000
Range of [MAX]	Open-loop: 0.0 to 3200.0 RFC-A, RFC-S: 0.000 to 3200.000
Definition	Open-loop mode If Ramp Rate Units (02.039) = 0: VM_ACCEL_RATE[MAX] = 3200.0 If Ramp Rate Units (02.039) = 1: VM_ACCEL_RATE[MAX] = 3200.0 x Pr 01.006 / 100.0 VM_ACCEL_RATE[MIN] = 0.0 RFC-A, RFC-S modes If Ramp Rate Units (02.039) = 0: VM_ACCEL_RATE[MAX] = 3200.000 If Ramp Rate Units (02.039) = 0: VM_ACCEL_RATE[MAX] = 3200.000 If Ramp Rate Units (02.039) = 1: VM_ACCEL_RATE[MAX] = 3200.000 x Pr 01.006 / 1000.0 VM_ACCEL_RATE[MAX] = 0.000
	If the second motor map is selected (Pr 11.045 = 1) Pr 21.001 is used instead of Pr 01.006.

Range of [MIN]	Open-loop: 0.0 RFC-A, RFC-S: 0.0					
Range of [MAX]	Open-loop: 599.0 RFC-A, RFC-S: 0.0 to 550 x 60 /	/ Motor pole pairs				
	(01.006), which in turn limit the r does not exceed the speed whe below. The limit is based on the possible to disable this limit if the that the motor can be operated a mode. It should be noted that the	MAX] defines the range of the positive reference clamp, <i>Maximum Reference Clamp</i> efferences. In RFC-A and RFC-S modes a limit is applied so that the position feedback re the drive can no longer interpret the feedback signal correctly as given in the table position feedback device selected with <i>Motor Control Feedback Select</i> (03.026). It is a <i>RFC Feedback Mode</i> (03.024) \geq 1 (i.e. VM_POSITIVE_REF_CLAMP1 = 50000.0), so at a speed above the level where the drive can interpret the feedback in sensorless e position feedback device itself may have a maximum speed limit that is lower than ould be taken not to exceed a speed that would cause damage to the position feedback				
	Feedback device	VM_POSITIVE_REF_CLAMP1[MAX]				
	AB, AB Servo	(500 kHz x 60 / rotary lines per revolution) rpm (500 kHz x linear line pitch in mm) mm/s				
Definition	FD, FR, FD Servo, FR Servo	(500 kHz x 60 / rotary lines per revolution)/2 rpm (500 kHz x linear line pitch in mm)/2 mm/s				
Deminion	SC, SC Hiper, SC EnDat, SC SSI, SC Servo	(500 kHz x 60 / sine waves per revolution) rpm (500 kHz x linear line pitch in mm) mm/s				
	Resolver	30000 rpm (250 Hz x pole pitch in mm) mm/s				
	Any other device	50000.0 rpm or mm/s				
	In RFC mode a limit is applied to limit for VM_POSITIVE_REF_CI	VE_REF_CLAMP1[MAX] is fixed at 599.0 Hz the speed reference of 550 x 60 / Motor pole pairs. Therefore, with a 4 pole motor the LAMP1[MAX] will be 16,500 rpm.				
	VM_POSITIVE_REF_CLAMP1[-				
		is defined in the same way as VM_POSITIVE_REF_CLAMP1 except MAX] defines the range of the positive reference clamp, <i>M2 Maximum Reference</i> nits the references.				

	VM_POWER	Range applied to parameters that either set or display power
Units	kW	
Range of [MIN]	-99999.999 to 0.000	
Range of [MAX]	0.000 to 99999.999	
Definition	with maximum a.c. out	rating dependent and is chosen to allow for the maximum power that can be output by the drive tput voltage, at maximum controlled current and unity power factor. √3 x VM_AC_VOLTAGE[MAX] x VM_DRIVE_CURRENT[MAX] / 1000

VM_RATE	CURRENT	Range applied to rated current parameters
Units	А	
Range of [MIN]	0.000	
Range of [MAX]	0.000 to 99999.999	
Definition	VM_RATED_CURRENT [Normal Duty rating of the VM_RATED_CURRENT [

Range of [MAX]	0 to 1150
Definition	VM_SUPPLY_LOSS_LEVEL[MAX] = VM_DC_VOLTAGE_SET[MAX] VM_SUPPLY_LOSS_LEVEL[MIN] is drive voltage rating dependent. See Table 12-4

VM_SWITCH	ING_FREQUENCY	Range applied to the maximum switching frequency parameters
Units	User units	
Range of [MIN]	0	
Range of [MAX]	0 to 6	
Definition		REQUENCY[MAX] = Power stage dependent REQUENCY[MIN] = 0 for motor control modes, or 1 for Regen mode (subject to the maximum)

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization		NV Media Card	Onboard	Advanced	Diagnostics	UL
information	information	installation	installation	started	parameters	the motor	-	communication	Operation	PLC	parameters	-	information

VM_TORQUE	_CURRENT Range applied to torque and Regen mode it refers to the	torque producing current parameters (where this is used in active current)				
Units	%					
Range of [MIN]	-1000.0 to 0.0					
Range of [MAX]	0.0 to 1000.0					
	Select Motor 2 Parameters (11.045)	VM_TORQUE_CURRENT [MAX]				
Definition	0	VM_MOTOR1_CURRENT_LIMIT[MAX]				
Demition	1 VM_MOTOR2_CURRENT_LIMIT[MAX]					
	VM_TORQUE_CURRENT[MIN] = -VM_TORQUE_CUR	RENT[MAX]				

VM_TORQUE_CUR	RENT_UNIPOLAR Unipo	lar version of VM_TORQUE_CURRENT
Units	%	
Range of [MIN]	0.0	
Range of [MAX]	0.0 to 1000.0	
Definition	VM_TORQUE_CURRENT_UNIF	OLAR[MAX] = VM_TORQUE_CURRENT[MAX] OLAR[MIN] =0.0

VM_USEF	R_CURRENT	Range applied to torque reference and percentage load parameters with one decimal place
Units	%	
Range of [MIN]	-1000.0 to 0.0	
Range of [MAX]	0.0 to 1000.0	
Definition	VM_USER_CURRENT[MI User Current Maximum Sc VM_USER_CURRENT_HI Torque Offset (04.009). Th output value to be defined The maximum value (VM_	AX] = User Current Maximum Scaling (04.024) N] = -VM_USER_CURRENT[MAX] valing (04.024) defines the variable maximum/minimums VM_USER_CURRENT and IGH_RES which are applied to <i>Percentage Load</i> (04.020), <i>Torque Reference</i> (04.008) and is is useful when routing these parameters to an analog output as it allows the full scale by the user. TORQUE_CURRENT_UNIPOLAR [MAX]) varies between drive sizes with default me drive sizes the default value may be reduced below the value given by the parameter

VM_USER_C	URRENT_HIGH_RES Range applied to torque reference and percentage load parameters with two decimal places
Units	%
Range of [MIN]	-1000.00 to 0.00
Range of [MAX]	0.00 to 1000.00
Definition	 VM_USER_CURRENT_HIGH_RES[MAX] = User Current Maximum Scaling (04.024) with an additional decimal place VM_USER_CURRENT_HIGH_RES[MIN] = -VM_USER_CURRENT_HIGH_RES[MAX] User Current Maximum Scaling (04.024) defines the variable maximum/minimums VM_USER_CURRENT and VM_USER_CURRENT_HIGH_RES which are applied to Percentage Load (04.020), Torque Reference (04.008) and Torque Offset (04.009). This is useful when routing these parameters to an analog output as it allows the full scale output value to be defined by the user. The maximum value (VM_TORQUE_CURRENT_UNIPOLAR [MAX]) varies between drive sizes with default parameters loaded. For some drive sizes the default value may be reduced below the value given by the parameter range limiting.

Table 12-4 Voltage ratings dependant values

Variable min/max		Voltage level (V)								
Valiable IIII/IIIax	200 V	400 V	575 V	690 V						
VM_DC_VOLTAGE_SET[MAX]	400	800	955	1150						
VM_DC_VOLTAGE[MAX]	415	830	990	1190						
VM_AC_VOLTAGE_SET[MAX]	265	530	635	765						
VM_AC_VOLTAGE[MAX]	325	650	780	930						
VM_STD_UNDER_VOLTS[MIN]	175	330	435	435						
VM_SUPPLY_LOSS_LEVEL[MIN]	205	410	540	540						
VM_HIGH_DC_VOLTAGE[MAX]	1500	1500	1500	1500

WARNING

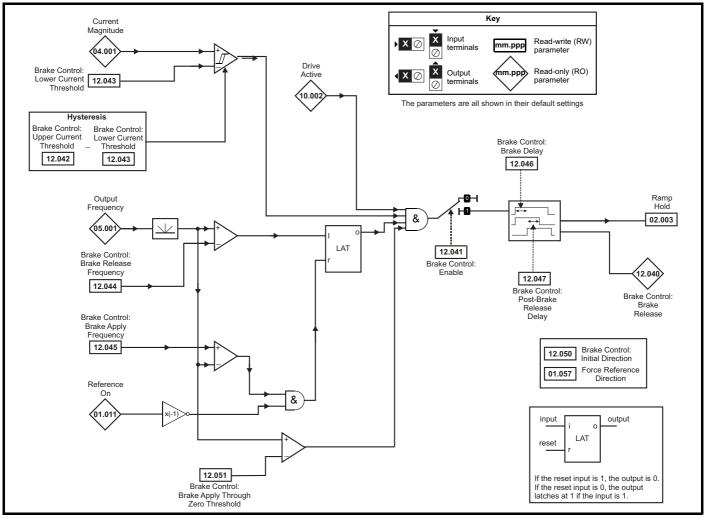

The brake control functions are provided to allow well co-ordinated operation of an external brake with the drive. While both hardware and software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury, independent protection devices of proven integrity must also be incorporated.

The control terminal relay can be selected as an output to release a brake. If a drive is set up in this manner and a drive replacement takes place, prior to programming the drive on initial power up, the brake may be released.

When drive terminals are programmed to non default settings the result of incorrect or delayed programming must be considered. The use of a NV media card in boot mode or an SI-Applications module can ensure drive parameters are immediately programmed to avoid this cituation.

The broke control functions are provide	had to allow wall a	po-ordinated operation of an external brake with the drive. While	both bardwara and

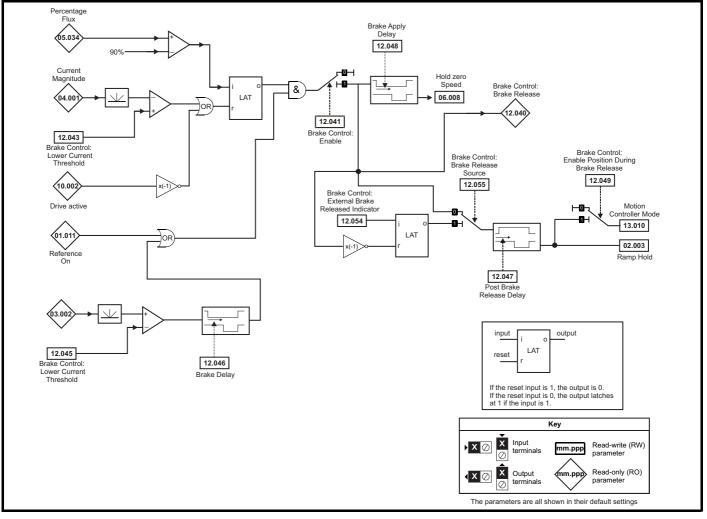

software are designed to high standards of quality and robustness, they are not intended for use as safety functions, i.e. where a fault or failure would result in a risk of injury. In any application where the incorrect operation of the brake release mechanism could result in injury, independent protection devices of proven integrity must also be incorporated.

The control terminal relay can be selected as an output to release a brake. If a drive is set up in this manner and a drive replacement takes place, prior to programming the drive on initial power up, the brake may be released.

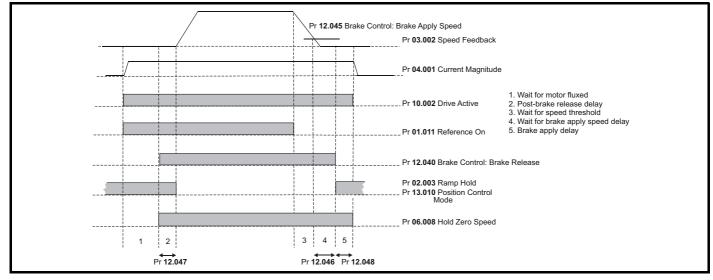

When drive terminals are programmed to non default settings the result of incorrect or delayed programming must be considered. The use of a NV media card in boot mode or an SI-Applications module can ensure drive parameters are immediately programmed to avoid this WARNING situation.

*The position controller is disabled and the error integrator is also reset under the following conditions:

- 1. If the drive is disabled (i.e. inhibited, ready or tripped)
- 2. If the position controller mode (Pr 13.010) is changed. The position controller is disabled transiently to reset the error integrator.
- 3. The absolute mode parameter (Pr 13.011) is changed. The position controller is disabled transiently to reset the error integrator.
- 4. One of the position sources is invalid.
- 5. The position feedback initialized parameter (Pr 03.048) is zero.

The option module ID indicates the type of module that is installed in the corresponding slot. See the relevant option module user guide for more information regarding the module.

Option module ID	Module	Category
0	No module installed	
0*	SI-Safety	Safety
105	SI-Encoder	Feedback
106	SI-Universal Encoder	
209	SI-I/O	Automation (I/O Expansion)
304	SI-Applications Plus	
310	MCi210	Automation (Applications)
311	MCi200	
431	SI-EtherCAT	
432	SI-PROFINET RT	
433	SI-Ethernet	
434	SI-PROFINET V2	Fieldbus
443	SI-PROFIBUS	
447	SI-DeviceNet	
448	SI-CANopen	

* There is no communication between the SI-Safety option module and the host drive via the option module connector, this is why the SI-Safety module ID is displayed as zero.

2 Optimization	Drive NV Media Card Onboard Advanced parameters Diagnostics UL information
----------------	--

13 **Diagnostics**

The keypad display on the drive gives various information about the status of the drive. The keypad display provides information on the following categories:

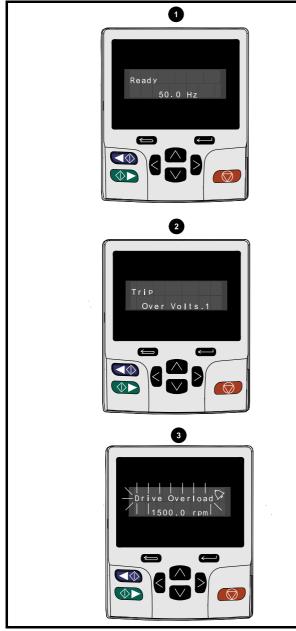

- Trip indications
- Alarm indications
- Status indications

Users must not attempt to repair a drive if it is faulty, nor carry out fault diagnosis other than through the use of the diagnostic features described in this chapter. If a drive is faulty, it must be returned to an authorized WARNING Control Techniques distributor for repair.

13.1 Status modes (Keypad and LED status)

Figure 13-1 Keypad status modes

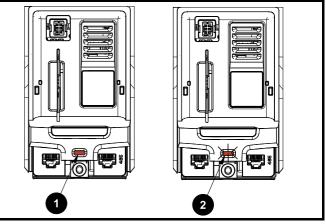

Drive OK status 1.

Trip status 2.

Alarm status 3

Figure 13-2 Location of the status LED

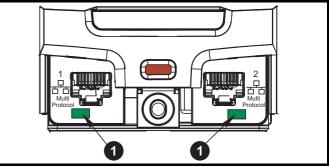

- 1. Non flashing: Normal status
- 2. Flashing: Trip status

Unidrive M700 / M702 Ethernet status LED 13.1.1

Each of the Ethernet ports provide a status LED for diagnostic and information purposes. Refer to Table 13-1 for Ethernet LED status.

Figure 13-3 Ethernet port status LED

1. Ethernet port status LED.

Table 13-1 Ethernet LED status

LED status	Description
Off	Ethernet connection not detected
Solid green	Ethernet connection detected but no data
Flashing green	Ethernet connection detected and data flow

13.2 Trip indications

The output of the drive is disabled under any trip condition so that the drive stops controlling the motor. If the motor is running when the trip occurs it will coast to a stop.

During a trip condition, where a KI-Keypad is being used, the upper row of the display indicates that a trip has occurred and the lower row of the keypad display will display the trip string. Some trips have a sub-trip number to provide additional information about the trip. If a trip has a sub-trip number, the sub-trip number is flashed alternately with the trip string unless there is space on the second row for both the trip string and the sub-trip number in which case both the trip string and sub-trip information is displayed separated by a decimal place.

The back-light of the KI-Keypad display will also flash during a trip condition. If a display is not being used, the drive LED Status indicator will flash with 0.5 s duty cycle if the drive has tripped. Refer to Figure 13-2

Trips are listed alphabetically in Table 13-4 based on the trip indication shown on the drive display. Alternatively, the drive status can be read in Pr **10.001** 'Drive OK' using communication protocols. The most recent trip can be read in Pr 10.020 providing a trip number. It must be noted that the hardware trips (HF01 to HF20) do not have trip numbers. The

Safety	Product	Mechanical	Electrical	Getting	Basic	Running	Optimization	Drive	NV Media Card	Onboard		Diagnostics	UL
information	information	installation	installation	started	parameters	the motor	- 1	communication	Operation	PLC	parameters		information

trip number must be checked in Table 13-5 to identify the specific trip.

Example

- 1. Trip code 2 is read from Pr 10.020 via serial communications.
- 2. Checking Table 13-4 shows Trip 2 is an Over Volts trip.

- 3. Look up Over Volts in Table 13-4.
- 4. Perform checks detailed under Diagnosis.

13.3 Identifying a trip / trip source

Some trips only contain a trip string whereas some other trips have a trip string along with a sub-trip number which provides the user with additional information about the trip.

A trip can be generated from a control system or from a power system. The sub-trip number associated with the trips listed in Table 13-2 is in the form xxyzz and used to identify the source of the trip.

Table 13-2 Trips associated with xxyzz sub-trip number

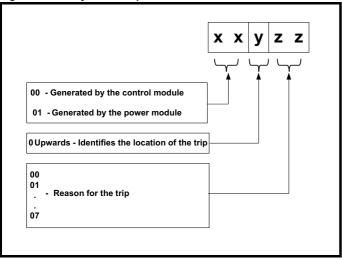

Over Volts	OHt dc bus
OI ac	Phase Loss
OI Brake	Power Comms
PSU	OI Snubber
OHt Inverter	Temp Feedback
OHt Power	Power Data
OHt Control	

The digits xx are 00 for a trip generated by the control system. For a single drive (not part of a multi-power module drive), if the trip is related to the power system then xx will have a value of 01, when displayed the leading zeros are suppressed.

The y digit is used to identify the location of a trip which is generated by a rectifier module connected to a power module (if xx is non zero). For a control system trip (xx is zero), the y digit, where relevant is defined for each trip. If not relevant, the y digit will have a value of zero.

The zz digits give the reason for the trip and are defined in each trip description.

Figure 13-4 Key to sub-trip number

For example, if the drive has tripped and the lower line of the display shows 'OHt Control.2', with the help of Table 13-3 below the trip can be interpreted as; an over temperature has been detected; the trip was generated by fault in the control module, the control board thermistor 2 over temperature. For further information on individual sub-trips, refer to the diagnosis column in Table 13-4.

Source	хх	у	ZZ	Description
Control system	00	0	01	Control board thermistor 1 over temperature
Control system	00	0	02	Control board thermistor 2 over temperature
Control system	00	0	03	Control board thermistor 3 over temperature

13.4 Trips, Sub-trip numbers

Table 13-4 Trip indications

Trip	Diagnosis							
An Input 1 Loss	Analog input 1 current loss (<i>Unidrive M700 / M701</i>)							
	An Input 1 Loss trip indicates that a current loss was detected in current mode on Analog input 1 (Terminal 5, 6). In 4-20 mA and 20-4 mA modes loss of input is detected if the current falls below 3 mA.							
	Recommended actions:							
28	 Check control wiring is correct Check control wiring is undamaged Check the <i>Analog Input 1 Mode</i> (07.007) Current signal is present and greater than 3 mA 							
An Input 2 Loss	Analog input 2 current loss (<i>Unidrive M700 / M701</i>)							
	An Input 2 Loss indicates that a current loss was detected in current mode on Analog input 2 (Terminal 7). In 4-20 mA and 20-4 mA modes loss of input is detected if the current falls below 3 mA.							
	Recommended actions:							
29	 Check control wiring is correct Check control wiring is undamaged 							
	Check the Analog Input 2 Mode (07.011)							
	Current signal is present and greater than 3 mA							
An Output Calib	Analog output calibration failed (Unidrive M700 / M701)							
	The zero offset calibration of one or both of the analog outputs has failed. This indicates that the drive hardware has failed or a voltage is applied to the output via a low impedance, possibly due to a wiring error. The failed output can be identified by the sub-trip number.							
	Sub-trip Reason							
219	1 Output 1 failed (Terminal 9) 2 Output 2 failed (Terminal 10)							
	Recommended actions:							
	 Check the wiring associated with analog outputs Remove all the wiring that is connected to analog outputs and perform a re-calibration by power cycling the drive If trip persists replace the drive 							
App Menu Changed	Customization table for an application module has changed							
	The <i>App Menu Changed</i> trip indicates that the customization table for an application menu has changed. The menu that has been changed can be identified by the sub-trip number.							
	Sub-trip Reason							
	1 Menu 18							
217	2 Menu 19							
217	3 Menu 20							
	If more than one menu has changed the lowest menu has priority. Drive user parameters must be saved to prevent this trip on the next power-up.							
	Recommended actions:							
	 Reset the trip and perform a parameter save to accept the new settings 							
P

178	already being acc Recommended								
		ption module to finish accessing the NV Media Card and re-attempt the required function							
188	Card Compare NV Media Card file/data is different to the one in the drive A compare has been carried out between a file on the NV Media Card and the drive. A Card Compare trip is initiated parameters on the NV Media Card are different to the drive. 188 Recommended actions:								
 Recommended actions: Set Pr mm.000 to 0 and reset the trip Check to ensure the correct data block on the NV Media Card has been used for the compare. 									
Card Data Exists		data location already contains data							
179	 The Card Data Exists trip indicates that an attempt has been made to store data on a NV Media Card in a data block which already contains data. No data is transferred. The data should be erased from the card first to prevent this trip. Recommended actions: Erase the data in data location 								
	Write data to an alternative data location								
Card Drive Mode	NV Media Card parameter set not compatible with current drive mode The Card Drive Mode trip is produced during a compare if the drive mode in the data block on the NV Media Card is								
187	 different from the current drive mode. This trip is also produced if an attempt is made to transfer parameters from a NV Media Card to the drive if the operating mode in the data block is outside the allowed range of operating modes. Recommended actions: Ensure the destination drive supports the drive operating mode in the parameter file. Clear the value in Pr mm.000 and reset the drive Ensure destination drive operating mode is the same as the source parameter file. 								
Card Error		data structure error							
	the data structure	ip indicates that an attempt has been made to access a NV Media Card but an error has been detected in o on the card. Resetting the trip will cause the drive to erase and create the correct folder structure. The can be identified by the sub-trip.							
	Sub-trip	Reason							
		The required folder and file structure is not present							
182		The <000> file is corrupted. Two or more files in the <mcdf\> folder have the same file identification number.</mcdf\>							
 Recommended actions: Erase all the data blocks and re-attempt the process Ensure the card is located correctly Replace the NV Media Card 									
Card Full	NV Media Card								
184	 The Card Full trip indicates that an attempt has been made to create a data block on a NV Media Card, but there is not enough space left on the card. Recommended actions: Delete a data block or the entire NV Media Card to create space Use a different NV Media Card 								
Card No Data	NV Media Card								
183	No data is transfe Recommended

Trip	Diagnosis								
Card Option	NV Media Card trip; option modules installed are different between source drive and destination drive								
180	 The <i>Card Option</i> trip indicates that parameter data or default difference data is being transferred from a NV Media Card to the drive, but the option module categories are different between source and destination drives. This trip does not stop the data transfer, but is a warning that the data for the option modules that are different will be set to the default values and not the values from the card. This trip also applies if a compare is attempted between the data block and the drive. Recommended actions: Ensure the correct option modules are installed. Ensure the option modules are in the same option module slot as the parameter set stored. Press the red reset button to acknowledge that the parameters for one or more of the option modules installed will be at their default values This trip can be suppressed by setting Pr mm.000 to 9666 and resetting the drive. NV Media Card data blocks are not compatible with the drive derivative 								
Card Product	NV Media Card data blocks are not compatible with the drive derivative								
	If <i>Drive Derivative</i> (11.028) or <i>Product Type</i> (11.063) are different between the source and target drives then this trip is initiated either at power-up or when the card is accessed. It will have one of the following sub-trip numbers:								
	Sub-trip Reason								
	1 If <i>Drive Derivative</i> (11.028) is different between the source and target drives, this trip is initiated either at power-up or when the SD Card is accessed. Data is still transferred, since this is a warning trip; the trip can be suppressed by entering code 9666 in parameter xx.000, and resetting the drive (this applies the warning suppression flag to the card).								
175	If <i>Product Type</i> (11.063) is different between the source and target drives or if corruption is detected in the parameter file, this trip is initiated either at power-up or when the SD Card is accessed. This trip can be reset but no data are transferred in either direction between the drive and the card.								
	A Unidrive SP parameter value was found that has no equivalent parameter on the destination drive. Data is still transferred, since this is a warning trip; the trip can be suppressed by entering code 9666 in Pr xx.000 , and resetting the drive (this applies the warning suppression flag to the card).								
	 Recommended actions: Use a different NV Media Card This trip can be suppressed by setting Pr mm.000 to 9666 and resetting the drive 								
Card Rating	NV Media Card Trip; The voltage and / or current rating of the source and destination drives are different								
186	The Card Rating trip indicates that parameter data is being transferred from a NV Media Card to the drive, but the current and / or voltage ratings are different between source and destination drives. This trip also applies if a compare (using Pr mm.000 set to 8yyy) is attempted between the data block on a NV Media Card and the drive. The Card Rating trip does not stop the data transfer but is a warning that rating specific parameters with the RA attribute may not be transferred to the destination drive. Recommended actions: • Reset the drive to clear the trip • Ensure that the drive rating dependent parameters have transferred correctly • This trip can be suppressed by setting Pr mm.000 to 9666 and resetting the drive								
Card Read Only	NV Media Card has the Read Only bit set								
181	The <i>Card Read Only</i> trip indicates that an attempt has been made to modify a read-only NV Media Card or a read-only of block. A NV Media Card is read-only if the read-only flag has been set. Recommended actions:								
	Clear the read only flag by setting Pr mm.000 to 9777 and reset the drive. This will clear the read-only flag for all data blocks in the NV Media Card								
Card Slot	NV Media Card Trip; Option module application program transfer has failed The <i>Card Slot</i> trip is initiated, if the transfer of an option module application program to or from an application module failed								
174	because the option module does not respond correctly. If this happens this trip is produced with the sub-trip indicating the option module slot number.								
	Recommended actions:								
	Ensure the source / destination option module is installed on the correct slot

		<i>Fail</i> trip indicates that default parameters have been loaded. The exact cause/reason of the trip can be the sub-trip number.									
	Sub-trip	Reason									
	1	The most significant digit of the internal parameter database version number has changed									
	2	The CRCs applied to the parameter data stored in internal non-volatile memory indicate that a valid set of parameters cannot be loaded									
		The drive mode restored from internal non-volatile memory is outside the allowed range for the product or the derivative image does not allow the previous drive mode									
	4	The drive derivative image has changed									
	5	The power stage hardware has changed									
	6	The internal I/O hardware has changed									
	7	The position feedback interface hardware has changed									
	8 The control board hardware has changed										
31	9 The checksum on the non-parameter area of the EEPROM has failed										
	The drive holds two banks of user save parameters and two banks of power down save parameters in non-volatile memory. If the last bank of either set of parameters that was saved is corrupted a <i>User Save</i> or <i>Power Down Save</i> trip is produced. If one of these trips occurs the parameters values that were last saved successfully are used. It can take some time to save parameters when requested by the user and if the power is removed from the drive during this process it is possible to corrupt the data in the non-volatile memory. If both banks of user save parameters or both banks of power down save parameters are corrupted or one of the other										
	conditions given in the table above occurs EEPROM Fail.xxx trip is produced. If this trip occurs it is not possible to data that has been saved previously, and so the drive will be in lowest allowed drive mode with default parameters. can only be reset if Pr mm.000 (mm.000) is set to 10, 11, 1233 or 1244 or if <i>Load Defaults</i> (11.043) is set to a non-value.										
		Recommended actions: • Default the drive and perform a reset									
	 Default the drive and perform a reset Allow sufficient time to perform a save before the supply to the drive is removed If the trip persists - return drive to supplier 										
Encoder 1		n feedback interface power supply overload									
		trip indicates that the drive encoder power supply has been overloaded. Terminals 13 &14 of the 15 way D can supply a maximum current of 200 mA @ 15 V or 300 mA @ 8 V and 5 V.									
	Recommende	actions:									
189	 Check encoder power supply wiring Disable the termination resistors (Pr 03.039 set to 0) to reduce current consumption For 5 V encoders with long cables, select 8 V (Pr 03.036) and install a 5 V voltage regulator close to the Check the encoder specification to confirm if it is compatible with the encoder port power supply current Replace the encoder 										
		ternal power supply with higher current capability									
Encoder 2		r (Feedback) wire break									
		2 trip indicates that the drive has detected a wire break on the 15 way D-type connector on the drive. The the trip can be identified from the sub-trip number.									
	Sub-trip	Reason									
	1	Drive position feedback interface 1 on any input									
	2	Drive position feedback interface 2 on any input									
	11	Drive position feedback interface 1 on the A channel									
	12	Drive position feedback interface 1 on the B channel									
190	13	Drive position feedback interface 1 on the Z channel									
	Recommende Ensure that connected If wire breat Check cab Check wiri	ed actions: at the position feedback device type selected in Pr 03.038 is correct for the position feedback device to the P1 interface on the drive. ak detection on the drive encoder input is not required, set Pr 03.040 = XXX0 to disable the Encoder 2 trip le continuity ng of feedback signals is correct									
	 Check end Replace end 	oder power supply is set correctly (Pr 03.036) ncoder									

information installation installation started parameters the motor of the motor communication Operation PLC parameters theorem information	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	Drive communication	NV Media Card Operation	Onboard PLC	Advanced parameters	Diagnostics	UL information

Trip	Diagnosis									
Encoder 3	Phase offset incorrect while running									
	The <i>Encoder 3</i> trip indicates that the drive has detected an incorrect UVW phase angle while running (RFC-S mode only) or SINCOS phase error. The feedback device which has caused the trip can be identified by the sub-trip number.									
	Sub-trip Reason									
	1 Drive position feedback interface 1									
	2 Drive position feedback interface 2									
	Recommended actions:									
191	Check encoder shield connections									
	 Ensure the encoder cable is one uninterrupted cable Check the encoder signal for noise with an oscilloscope 									
	Check the integrity of the encoder mechanical mounting									
	 For a UVW servo encoder, ensure that the phase rotation of the UVW commutation signals is the same as the phase rotation of the motor 									
	 the phase rotation of the motor For a SINCOS encoder, ensure that motor and incremental SINCOS connections are correct and that for forward 									
	rotation of the motor, the encoder rotates clockwise (when looking at the shaft of the encoder)									
	Repeat the offset measurement test									
Encoder 4	Feedback device comms failure									
	The Encoder 4 trip indicates that the encoder communications has timed out or the communications position message transfer time is too long. This trip can also be caused due to wire break in the communication channel between									
	the drive and the encoder. The feedback device which has caused the trip can be identified by the sub-trip number.									
	Sub-trip Reason									
	1 Drive position feedback interface 1									
192	2 Drive position feedback interface 2									
	Recommended actions:									
	 Ensure the encoder power supply setting (Pr 03.036) is correct 									
	Complete encoder auto-configuration (Pr 03.041)									
	Check the encoder wiring									
Encoder 5	Replace the feedback device Checksum or CRC error									
Elicodel 3	The Encoder 5 trip indicates that there is a checksum or CRC error, or the SSI encoder is not ready. The Encoder 5 trip can									
	also indicate a wire break to a communications based encoder.									
	Sub-trip Reason									
	1 Drive position feedback interface 1									
	2 Drive position feedback interface 2									
193	Recommended actions:									
133	Check the encoder cable shield connections									
	• Ensure the cable is one uninterrupted cable - remove any connector blocks or if unavoidable minimise the length of any									
	shield pigtails to the connector block									
	 Check the encoder signal for noise with an oscilloscope Check the comms resolution setting (Pr 03.035) 									
	 If using a Hiperface, EnDat encoder carry out an encoder auto-configuration (Pr 03.041 = Enabled) 									
	Replace the encoder									
Encoder 6	Encoder has indicated an error									
	The <i>Encoder 6</i> trip indicates that the encoder has indicated an error or that the power supply has failed to an SSI encoder. The <i>Encoder 6</i> trip can also indicate a wire break to an SSI encoder.									
	Sub-trip Reason									
194	1 Drive position feedback interface 1 2 Drive position feedback interface 2									
	Recommended actions:									
	- For SSI anadore, sheet the wiring and aneader newer supply setting (Dr 02 026)									
	 For SSI encoders, check the wiring and encoder power supply setting (Pr 03.036) Replace the encoder / contact the supplier of the encoder

---	---

Trip	Diagnosis							
Encoder 14	The data given in the additional configuration parameter for a position feedback interface is out of range							
164	The Encoder 14 trip indicates that the data given in the additional configuration parameter for a position feedback interface is out of range. If the sub-trip number is one then the data is out of range in <i>P1 Additional Configuration</i> (03.074), or if the sub-trip number is 2 the data is out of range in <i>P2 Additional Configuration</i> (03.174). Not all position feedback devices use the additional configuration, but those that do are listed below. BiSS Range checking is applied to the turns padding (decimal digits 5-3) and position padding (decimal digits 2-0). If these give a padding value outside +/-16 then the trip is initiated. Note that in each case the most significant digit indicates left (0) or right (1) padding, and the least significant 2 digits indicate the number of bits							
External Trip	An External trip is initiated							
	An <i>External Trip</i> has occurred. The cause of the trip can be identified from the sub trip number displayed after the trip string. See table below. An external trip can also be initiated by writing a value of 6 in Pr 10.038 .							
	Sub-trip Reason							
	1 External Trip Mode (08.010) = 1 or 3 and Safe Torque Off input 1 is low							
	2 External Trip Mode (08.010) = 2 or 3 and Safe Torque Off input 2 is low							
	3 External Trip (10.032) = 1							
6	Recommended actions:							
	 Check the Safe Torque Off signal voltage (on terminal 31 on <i>Unidrive M700 / M701</i> and terminal 11 & 13 on <i>Unidrive M702</i>) equals to 24 V. Check the value of Pr 08.009 which indicates the digital state of terminal 31 on <i>Unidrive M700 / M701</i> and terminal 11 & 13 on <i>Unidrive M702</i>, equates to 'on'. If external trip detection of the Safe Torque Off input is not required, set Pr 08.010 to OFF (0). Check the value of Pr 10.032. Select 'Destinations' (or enter 12001) in Pr mm.000 and check for a parameter controlling Pr 10.032. Ensure Pr 10.032 or Pr 10.038 (= 6) is not being controlled by serial comms 							
HF01	Data processing error: CPU address error							
	The <i>HF01</i> trip indicates that a CPU address error has occurred. This trip indicates that the control PCB on the drive has failed. Recommended actions: Hardware fault – Contact the supplier of the drive							
HF02	Data processing error: DMAC address error							
	 The <i>HF02</i> trip indicates that a DMAC address error has occurred. This trip indicates that the control PCB on the drive has failed. Recommended actions: Hardware fault – Contact the supplier of the drive 							
HF03	Data processing error: Illegal instruction							
	 The <i>HF03</i> trip indicates that an illegal instruction has occurred. This trip indicates that the control PCB on the drive has failed. Recommended actions: Hardware fault – Contact the supplier of the drive 							
HF04	Data processing error: Illegal slot instruction							
	 The <i>HF04</i> trip indicates that an illegal slot instruction has occurred. This trip indicates that the control PCB on the drive has failed. Recommended actions: Hardware fault – Contact the supplier of the drive 							
HF05	Data processing error: Undefined exception							
	The <i>HF05</i> trip indicates that an undefined exception error has occurred. This trip indicates that the control PCB on the drive has failed. Recommended actions: Hardware fault – Contact the supplier of the drive							
HF06	Data processing error: Reserved exception							
	 The <i>HF06</i> trip indicates that a reserved exception error has occurred. This trip indicates that the control PCB on the drive has failed. Recommended actions: Hardware fault – Contact the supplier of the drive

-------------	--------	--	--	--	--	--	--	--------------	--	--	----------------	--	-------------	-------------------

Trip	Diagnosis
HF07	Data processing error: Watchdog failure
	The HF07 trip indicates that a watchdog failure has occurred. This trip indicates that the control PCB on the drive has failed.
	Recommended actions:
	Hardware fault – Contact the supplier of the drive
HF08	Data processing error: CPU Interrupt crash
	The HF08 trip indicates that a CPU interrupt crash has occurred. This trip indicates that the control PCB on the drive has
	failed.
	Recommended actions:
	Hardware fault – Contact the supplier of the drive
HF09	Data processing error: Free store overflow
	The <i>HF09</i> trip indicates that a free store overflow has occurred. This trip indicates that the control PCB on the drive has
	failed.
	Recommended actions:
	Hardware fault – Contact the supplier of the drive
HF10	Data processing error: Parameter routing system error
	The <i>HF10</i> trip indicates that a Parameter routing system error has occurred. This trip indicates that the control PCB on the drive has failed.
	Recommended actions:
HF11	Hardware fault – Contact the supplier of the drive Data processing error: Access to EEPROM failed
	The <i>HF11</i> trip indicates that access to the drive EEPROM has failed. This trip indicates that the control PCB on the drive
	has failed.
	Recommended actions:
	Hardware fault – Contact the supplier of the drive
HF12	Data processing error: Main program stack overflow
	The <i>HF12</i> trip indicates that the main program stack over flow has occurred. The stack can be identified by the sub-trip
	number. This trip indicates that the control PCB on the drive has failed.
	Sub-trip Stack
	1 Background tasks
	2 Timed tasks
	3 Main system interrupts
	Recommended actions:
	Hardware fault – Contact the supplier of the drive
HF13	Data processing error: Firmware incompatible with hardware
	The <i>HF13</i> trip indicates that the drive firmware is not compatible with the hardware. This trip indicates that the control PCB
	on the drive has failed. The sub-trip number gives the actual ID code of the control board hardware.
	Recommended actions:
	 Re-program the drive with the latest version of the drive firmware for Unidrive M700 / M701 / M702 Hardware fault – Contact the supplier of the drive
HF14	Data processing error: CPU register bank error
	The <i>HF14</i> trip indicates that a CPU register bank error has occurred. This trip indicates that the control PCB on the drive
	has failed.
	Recommended actions:
	Hardware fault – Contact the supplier of the drive
HF15	Data processing error: CPU divide error
	The HF15 trip indicates that a CPU divide error has occurred. This trip indicates that the control PCB on the drive has
	failed.
	Recommended actions:
	Hardware fault – Contact the supplier of the drive
HF16	Data processing error: RTOS error
	The HF16 trip indicates that a RTOS error has occurred. This trip indicates that the control PCB on the drive has failed.
	Recommended actions:
	Hardware fault – Contact the supplier of the drive

Trip			Diagnosis						
Inductance	Inductance	e measurement out of ran	nge or motor saturation not detected						
	This trip oc being atten	curs in RFC-S mode when	the drive has detected that the motor inductances are not suitable for the op used because the ratio or difference between Ld and Lq is too small or becau						
	If the inductance ratio or difference is too small this is because one of the following conditions is true:								
	(No-load Lq (05.072)- Ld (05.024)) / Ld (05.024) < 0.1								
	(No-load Lo	q (05.072) - Ld (05.024)) < () < (K / Full Scale Current Kc (11.061))H						
	where:								
		ed voltage (11.033)	K						
	200 V		0.0073						
	400 V		0.0146						
	575 V		0.0174						
	690 V		0.0209						
	measured v applied in t (11.061)).	value of Ld does change su he d axis of the motor in ea	notor cannot be measured this is because when the flux in the motor is chang ufficiently due to saturation to be measured. When half of <i>Rated Current</i> (05.) ach direction the inductance must fall change at least (K / (2 x <i>Full Scale Current</i>) ub-trips are given in the table below:	007) is					
	Sub-trip	Reason							
	1	The inductance ratio or dif	ifference is too small when the drive has been started in sensorless mode.						
8	2	The saturation characteris sensorless mode.	stic of the motor cannot be measured when the drive has been started in						
	The inductance ratio or difference is too small when an attempt is made to determine the location of motor flux during a stationary auto-tune in RFC-S mode. This trip is also produced when the inductan or inductance difference is too small when carrying out a phasing test on starting in RFC-S mode. If geedback is being used the measured value for <i>Position Feedback Phase Angle</i> (03.025) may not be reliable. Also the measured values of <i>Ld</i> (05.024) and <i>No-load Lq</i> (05.072) may not correspond to the g axis respectively.								
	4	is initiated if the change ca	n the motor is detected by the change of inductance with different currents. Th cannot be detected when an attempt is made to perform a stationary auto-tun s being used, or to perform a phasing test on starting in RFC-S mode.						
	Recommended actions for sub-trip 1:								
	• Ensure that RFC Low Speed Mode (05.064) is set to Non-salient (1), Current (2) or Current No test (3).								
	Recommended actions for sub-trip 2:								
	• Ensure that <i>RFC Low Speed Mode</i> (05.064) is set to Non-salient (1), Current (2) or Current No test (3).								
	Recommended actions for sub-trip 3:								
	None. The trip acts as a warning.								
	Recomme	nded actions for sub-trip	4:						
			e. Perform a minimal movement or rotating autotune. ssible. Use a position feedback device with commutation signals or absolute	oosition.					
Inductor Too Hot		inductor has overloaded							
	Inductor Th	ermal Time Constant (Pr 04	egen inductor thermal overload based on the <i>Rated Current</i> (Pr 05.007) and t 4.015). Pr 04.019 displays the inductor temperature as a percentage of the m too <i>Hot</i> when Pr 04.019 gets to 100 %.						
93		nded actions:	00 1101 When PT 04.019 gets to 100 %.						
	Check		the inductor has not changed. 007) is not zero.						
Inter-connect		er module drive interconn							
103	The Inter-c which power initiated if the	onnect trip indicates a multi er module has detected the he communication fails eith	ti-power module drive interconnection cable error. The sub-trip "xx.0.00" indic a fault where xx is the power module number. It should be noted that this trip her when a rectifier signals a fault or a trip is reset. In this case, the sub-trip is	is also					
	number of	modules that are still comm	nunicating correctly.

Trip		Diagnosis
I/O Overload	Digital output of	overload
		<i>d</i> trip indicates that the total current drawn from 24 V user supply or from the digital output has exceeded s initiated if one or more of the following conditions:
		utput current from one digital output is 100 mA.
26		ed maximum output current from outputs 1 and 2 is 100 mA ed maximum output current from output 3 and +24 V output is 100 mA
20	Recommended	
	Check total	loads on digital outputs
		ol wiring is correct
		ut wiring is undamaged
Island		n detected in regen mode
		ndicates that the AC mains is no longer present and the inverter would be an 'islanded' power supply if it erate. The sub-trip indicates the reason for the trip.
	Sub-trip	Description
	1	Island detection system has been enabled and detected an island condition
160	2	The minimum synchronization voltage is non-zero and the supply voltage has been below this threshold and been simulating its own supply synchronization for more than 2.0 s.
	Recommended	actions:
		upply / supply connections to the regen drive
Keypad Mode		en removed when the drive is receiving the speed reference from the keypad
		<i>de</i> trip indicates that the drive is in keypad mode [<i>Reference Selector</i> (01.014) = 4 or 6 or M2 reference = 4 or 6 if motor map 2 is selected] and the keypad has been removed or disconnected from the drive.
34	Recommended	actions:
		eypad and reset
Line Syne	÷	ference Selector (01.014) to select the reference from another source
Line Sync	-	on to the power supply has been lost rip indicates that the inverter has lost the synchronization with the ac supply in Regen mode.
39	Recommended	
	Check the s	upply / supply connections to the regen drive
Low Load		e drive has fallen below the low load detection level
		ad detector is active, the low load condition is detected when the <i>Percentage Load</i> (Pr 04.020) falls below
		fined by the <i>Low Load Detection Level</i> (Pr 04.027). Low Load (Pr 04.029) defines the action taken when low load is detected. If <i>Enable Trip On Low Load</i>
38	,	a Low Load warning is displayed and Low Load Detected Alarm (Pr 10.062) = 1. If Enable Trip On Low
) = 1 no warning is given, but a Low Load trip is initiated.
	Check the log	l actions: bad on the motor has not changed
Motor Too Hot		overload timed out (l ² t)
	•	Hot trip indicates a motor thermal overload based on the Rated Current (Pr 05.007) and Motor Thermal
	Time Constant (Pr 04.015). Pr 04.019 displays the motor temperature as a percentage of the maximum value. The drive
	Recommended	r Too Hot when Pr 04.019 gets to 100 %.
		load is not jammed / sticking
		bad on the motor has not changed
20	 If seen during 	ng an auto-tune test in RFC-S mode, ensure the motor <i>Rated Current</i> in Pr 05.007 is ≤ Heavy duty current
	rating of the	drive ated Speed (Pr 05.008) (RFC-A mode only)
		back signal for noise
		motor rated current is not zero
	 This trip car Pr 04.016 to 	be disabled and current limiting activated on the motor overload by setting thermal protection mode 1.

Trip		Diagnosis
PSU 24V	24V internal po	wer supply overload
9	consists of the di Recommended	ad of the drive and option modules has exceeded the internal 24 V power supply limit. The user load rive digital outputs and main encoder supply. actions: load and reset
Rating Mismatch	Remove all o	xternal 24 V power supply on control terminal 2 option modules cognition: Multi module voltage or current rating mismatch
223	The Rating Mism This trip is only a voltage or currer Recommended	<i>natch</i> trip indicates that there is a voltage rating or current rating mismatch in a multi-module drive system. Applicable to modular drives that are connected in parallel. A mixture of power modules with different at ratings within the same multi-module drive system is not allowed and will cause a <i>Rating Mismatch</i> trip.
	Hardware fa	ult – Contact the supplier of the drive
Rectifier Set-up	A rectifier has r	not been set-up correctly in a multi-power module system
	A rectifier has no	t been set-up correctly in a multi-power module system
94	Recommended	action:
	Check the in	ter-power module wiring
Reserved	Reserved trips	
	These trip numb programs.	ers are reserved trip numbers for future use. These trips should not be used by the user application
01	Trip Number	· Description
95	01	Reserved resettable trip
104 – 108	95	Reserved resettable trip
165 - 168	104 - 108	Reserved resettable trip
170 – 173 222, 228 - 246	165 - 168	Reserved resettable trip
111, 110 140	170 - 173	Reserved resettable trip
	222, 228 - 24	6 Reserved non-resettable trip
Resistance	Measured resis	tance has exceeded the parameter range
	involving measu higher than the r <i>Current Kc</i> (11.0 measurement m then sub-trip 3 is the drive inverter	s that either the value being used for motor stator resistance is too high or that an attempt to do a test ring motor stator resistance has failed. The maximum for the stator resistance parameters is generally maximum value that can be used in the control algorithms. If the value exceeds ($V_{FS} / v2$) / <i>Full Scale</i> 61), where V_{FS} is the full scale DC bus voltage then this trip is initiated. If the value is the result of a ade by the drive then sub-trip 1 is applied, or if it is because the parameter has been changed by the user applied. During the stator resistance section of auto-tuning an additional test is performed to measured r characteristics to provide the compensation necessary for dead-times. If the inverter characteristic ils then sub-trip 2 is applied.
	Sub-trip	Reason
	1	Measured stator resistance exceeded the allowed range
	2	It was not possible to measure the inverter characteristic
33	3	The stator resistance associated with the presently selected motor map exceeds the allowed range
	presently sel Check the m Check the in Check the m Check the m Ensure the s	he value that has been entered in the stator resistance does not exceed the allowed range (for the lected motor map) otor cable / connections tegrity of the motor stator winding using a insulation tester lotor phase to phase resistance at the drive terminals lotor phase to phase resistance at the motor terminals lotor phase to phase resistance at the motor terminals lotor resistance of the motor falls within the range of the drive model boost mode (Pr 05.014 = Fixed) and verify the output current waveforms with an oscilloscope

Trip		Diagnosis							
Slot4 HF	Ethernet inte	erface in slot 4 hardware fault (<i>Unidrive M700 / M702</i>)							
	The Slot4 HF the sub-trip r	F trip indicates that the Ethernet interface in slot 4 cannot operate. The reason for the error can be identified by number.							
	Sub-trip	Reason							
	1 1	The module category cannot be identified							
	2 /	All the required customized menu table information has not been supplied or the tables supplied are corrupt							
	3 1	There is insufficient memory available to allocate the comms buffers for this module							
	4 7	The module has not indicated that it is running correctly during drive power-up							
	5 N	Module has been removed after power-up or it has stopped working							
250	6 1	The module has not indicated that it has stopped accessing drive parameters during a drive mode change							
	7	The module has failed to acknowledge that a request has been made to reset the drive processor							
	8 1	The drive failed to correctly read the menu table from the module during drive power up							
		The drive failed to upload menu tables from the module and timed out (5 s)							
		Menu table CRC invalid							
	Recommend	ded actions:							
		he Ethernet interface is installed correctly							
Slot4 Not Fitted		e fault - Contact the supplier of the drive. erface in slot 4 has been removed (Unidrive M700 / M702)							
		of <i>Fitted</i> trip indicates that the Ethernet interface in slot 4 on the drive has been removed since the last power-							
	up.								
253	Recommend	ded actions:							
		he Ethernet interface is installed correctly							
Slot4 Watchdog		e fault - Contact the supplier of the drive. erface watchdog service error (Unidrive M700 / M702)							
Clot+ Matchaog		atchdog trip indicates that the Ethernet interface installed in slot 4 has started the option watchdog function and							
251	then failed to	service the watchdog correctly.							
251		ded actions:							
		e fault - Contact the supplier of the drive.							
Slot App Menu		menu Customization conflict error Menu trip indicates that more than one option slot has requested to customize the application menus 18, 19							
		sub-trip number indicates which option slot has been allowed to customize the menus.							
216	Recommend	ded actions:							
	Ensure t	hat only one of the Application modules is configured to customize the application menus 18, 19 and 20							
SlotX Different	•	ule in option slot X has changed							
		<i>ifferent</i> trip indicates that the option module in option slot X on the drive is a different type to that installed when vere last saved on the drive. The sub-trip number gives the identification code of the module that was originally							
		ason for the trip can be identified by the sub-trip number.							
	Sub-trip	Reason							
	1	No module was installed previously							
	2	A module with the same identifier is installed, but the set-up menu for this option slot has been							
204	2	changed, and so default parameters have been loaded for this menu.							
209	3	A module with the same identifier is installed, but the applications menu for this option slot has been changed, and so default parameters have been loaded for this menu.							
214	A module with the same identifier is installed, but the set-up and applications menu for this option slot								
		have been changed, and so default parameters have been loaded for these menus.							
	>99	Shows the identifier of the module previously installed.							
	Recommend	ded actions:							
		the power, ensure the correct option modules are installed in the correct option slots and re-apply the power.							
		that the currently installed option module is correct, ensure option module parameters are set correctly and a user save in Pr mm.000 .							
	perform :	a user save in Pl mm.uuu.

Trip	Diagnosis
SlotX Error	Option module in option slot X has detected a fault
202	The <i>SlotX Error</i> trip indicates that the option module in option slot X on the drive has detected an error. The reason for the error can be identified by the sub-trip number.
207 212	Recommended actions:
	See the relevant Option Module User Guide for details of the trip
SlotX HF	Option module X hardware fault
	The <i>SlotX HF</i> trip indicates that the option module in option slot X cannot operate. The possible causes of the trip can be identified by the sub-trip number.
	Sub-trip Reason
	1 The module category cannot be identified
	2 All the required customized menu table information has not been supplied or the tables supplied are corrupt
	3 There is insufficient memory available to allocate the comms buffers for this module
	4 The module has not indicated that it is running correctly during drive power-up
	5 Module has been removed after power-up or it has stopped working
200 205	6 The module has not indicated that it has stopped accessing drive parameters during a drive mode change
210	7 The module has failed to acknowledge that a request has been made to reset the drive processor
	8 The drive failed to correctly read the menu table from the module during drive power up
	9 The drive failed to upload menu tables from the module and timed out (5 s)
	10 Menu table CRC invalid
	Recommended actions:
	Ensure the option module is installed correctly
	Replace the option module
ClotX Not Fitted	Replace the drive
SlotX Not Fitted	Option module in option slot X has been removed The SlotX Not Fitted trip indicates that the option module in option slot X on the drive has been removed since the last
	power up.
203 208	Recommended actions:
213	Ensure the option module is installed correctly.
	 Re-install the option module. To confirm that the removed option module is no longer required perform a save function in Pr mm.000.
SlotX Watchdog	Option module watchdog function service error
	The SlotX Watchdog trip indicates that the option module installed in Slot X has started the option watchdog function and
201	then failed to service the watchdog correctly.
206 211	Recommended actions:
	Replace the option module
Soft Start	Soft start relay failed to close, soft start monitor failed
222	The Soft Start trip indicates that the soft start relay in the drive failed to close or the soft start monitoring circuit has failed.
226	Recommended actions:
Stored HF	Hardware fault – Contact the supplier of the drive Hardware trip has occurred during last power down
	The Stored HF trip indicates that a hardware trip (HF01 –HF20) has occurred and the drive has been power cycled. The
004	sub-trip number identifies the HF trip i.e. stored HF.17.
221	Recommended actions:
	Enter 1299 in Pr mm.000 and press reset to clear the trip

Trip		Diagnosis							
Th Short Circuit	Motor thermis	tor short circuit							
		<i>Circuit</i> trip indicates that the motor thermistor connected to the drive is short circuit or low impedance i.e. cation of the trip can be identified by the sub-trip number.							
	Sub-trip	Source							
	3	Analog input 3							
25	4	Position feedback interface							
	Recommende								
		mistor continuity otor / motor thermistor							
Thermistor	Motor thermis	tor over-temperature							
		r trip indicates that the motor thermistor connected to the drive has indicated a motor over temperature. The trip can be identified by the sub-trip number.							
	Sub-trip	Source							
	3	Analog input 3							
24	4	Position feedback interface							
	Recommende	d actions:							
		or temperature							
		eshold Level (07.048) mistor continuity							
Undefined	Drive has trip	ped and the cause of the trip is Undefined							
	The Undefined cause of the tri	trip indicates that the power system has generated but did not identify the trip from the power system. The p is unknown.							
110	Recommende	d actions:							
	Hardware fault – return the drive to the supplier								
User 24V	-	ply is not present on control terminals (1,2)							
		p is initiated, if <i>User Supply Select</i> (Pr 06.072) is set to 1 or <i>Low Under Voltage Threshold Select</i> (06.067) Supply Mode Enable (06.068) = 1 and no user 24 V supply is present on control terminals 1 and 2.							
91	Recommende	d actions:							
	Ensure the	user 24 V supply is present on control terminals 1 (0V) and 2 (24V)

Trip	Diagnosis								
User Prog Trip	Trip generated by an onboard user program								
	This trip can be initiated from within an onboard user program using a function call which defines the sub-trip number.								
96	Recommended actions:								
	Check the user program								
User Save	User Save error / not completed								
	The User Save trip indicates that an error has been detected in the user save parameters saved in non-volatile memory. For example, following a user save command, If the power to the drive was removed when the user parameters were being saved.								
36	Recommended actions:								
	 Perform a user save in Pr mm.000 to ensure that the trip doesn't occur the next time the drive is powered up. Ensure that the drive has enough time to complete the save before removing the power to the drive. 								
User Trip	User generated trip								
40 -89	These trips are not generated by the drive and are to be used by the user to trip the drive through an application program.								
40 -09 112 -159	Recommended actions:								
	Check the user program								
Voltage Range	Supply voltage out of range detected in Regen mode								
	The <i>Voltage Range</i> trip is initiated, if the Regen <i>Minimum Voltage</i> (03.026) is set to a non-zero value and the supply voltage is outside the range defined by <i>Regen Maximum Voltage</i> (03.027) and <i>Regen Minimum Voltage</i> (03.026) for more than 100 ms.								
	Recommended actions:								
169	Ensure the supply voltage is operating within the drive specification.								
	Ensure Pr 03.026 and Pr 03.027 are set correctly								
	 Check the supply voltage waveform using an oscilloscope Reduce the level of supply disturbance 								
	 Set Maximum Voltage (03.027) to zero to disable the trip. 								
Watchdog	Control word watchdog has timed out								
	The Watchdog trip indicates that the control word has been enabled and has timed out.								
	Recommended actions:								
30	Once Pr 06.042 bit 14 has been changed from 0 to 1 to enable the watchdog, this must be repeated every 1 s or a Watchdog trip will be initiated. The watchdog is disabled when the trip occurs and must be re-enabled if required when the trip is reset.

The trips can be grouped into the following categories. It should be noted that a trip can only occur when the drive is not tripped or is already tripped but with a trip with a lower priority number.

Table 13-6 Trip categories

Priority	Category	Trips	Comments			
1	1 Internal faults HFxx		These indicate internal problems and cannot be reset. All drive features are inactive after any of these trips occur. If an KI-Keypad is installed it will show the trip, but the keypad will not function.			
1	1 Stored HF trip {Stored HF}		This trip cannot be cleared unless 1299 is entered into <i>Parameter</i> (mm.000) and a reset is initiated.			
2	Non-resettable trips	Trip numbers 218 to 247, {Slot1 HF}, {Slot2 HF}, {Slot3 HF} or {Slot4 HF}	These trips cannot be reset.			
3	3 Volatile memory failure {EEPROM Fail}		This can only be reset if Parameter mm.000 is set to 1233 or 1244, o <i>Load Defaults</i> (11.043) is set to a non-zero value.			
4	NV Media Card trips	Trip numbers 174, 175 and 177 to 188	These trips are priority 5 during power-up.			
4	4 Internal 24V and position feedback interface power supply {PSU 24V} and {Encoder 1}		These trips can override {Encoder 2} to {Encoder 6} trips.			
5	Trips with extended reset times	{OI ac}, {OI Brake}, and OI dc}	These trips cannot be reset until 10 s after the trip was initiated.			
5	Phase loss and d.c. link power circuit protection	{Phase Loss} and {Oht dc bus}	The drive will attempt to stop the motor before tripping if a {Phase Loss}. 000 trip occurs unless this feature has been disabled (see <i>Action On Trip</i> <i>Detection</i> (10.037). The drive will always attempt to stop the motor before tripping if an {Oht dc bus} occurs.			
5	Standard trips	All other trips				

13.5 Internal / Hardware trips

Trips {HF01} to {HF25} are internal faults that do not have trip numbers. If one of these trips occurs, the main drive processor has detected an irrecoverable error. All drive functions are stopped and the trip message will be displayed on the drive keypad. If a non permanent trip occurs this may be reset by power cycling the drive. On power up after it has been power cycled the drive will trip on Stored HF. The sub-trip code is the number of the original HF trip. Enter 1299 in **mm.000** to clear the Stored HF trip.

--	----

13.6 Alarm indications

In any mode, an alarm is an indication given on the display by alternating the alarm string with the drive status string on the first row and showing the alarm symbol in the last character in the first row. If an action is not taken to eliminate any alarm except "Auto Tune and Limit Switch" the drive may eventually trip. Alarms are not displayed when a parameter is being edited, but the user will still see the alarm character on the upper row.

Table 13-7 Alarm indications

Alarm string	Description
Brake Resistor	Brake resistor overload. <i>Braking Resistor Thermal</i> <i>Accumulator</i> (10.039) in the drive has reached 75.0 % of the value at which the drive will trip.
Motor Overload	Motor Protection Accumulator (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is >100 %.
Ind Overload	Regen inductor overload. <i>Inductor Protection</i> <i>Accumulator</i> (04.019) in the drive has reached 75.0 % of the value at which the drive will trip and the load on the drive is >100 %.
Drive Overload	Drive over temperature. <i>Percentage Of Drive</i> <i>Thermal Trip Level</i> (07.036) in the drive is greater than 90 %.
Auto Tune	The autotune procedure has been initialized and an autotune in progress.
Limit Switch	Limit switch active. Indicates that a limit switch is active and that is causing the motor to be stopped.

13.7 Status indications

Table 13-8 Status indications

Upper row string	Description	Drive output stage
Inhibit	The drive is inhibited and cannot be run. The Safe Torque Off signal is not applied to Safe Torque Off terminals or Pr 06.015 is set to 0	Disabled
Ready	Disabled	
Stop	The drive is stopped / holding zero speed.	Enabled
Run	The drive is active and running	Enabled
Scan	The drive is enabled in Regen mode and is trying to synchronize to the supply	Enabled
Supply Loss	Supply loss condition has been detected	Enabled
Deceleration	The motor is being decelerated to zero speed / frequency because the final drive run has been deactivated.	Enabled
dc injection	The drive is applying dc injection braking	Enabled
Position	Positioning / position control is active during an orientation stop	Enabled
Trip	The drive has tripped and no longer controlling the motor. The trip code appears in the lower display	Disabled
Active	The regen unit is enabled and synchronized to the supply	Enabled
Under Voltage	The drive is in the under voltage state either in low voltage or high voltage mode	Disabled
Heat	The motor pre-heat function is active	Enabled
Phasing	The drive is performing a 'phasing test on enable'.	Enabled

Table 13-9 Option module and NV Media Card and other status indications at power-up

	-	-							
First row string	Second row string	Status							
Booting	Parameters	Parameters are being loaded							
Drive param	eters are being loade	d from a NV Media Card							
Booting	User Program	User program being loaded							
User program is being loaded from a NV Media Card to the drive									
Booting	Option Program	User program being loaded							
User program is being loaded from a NV Media Card to the option module in slot X									
Writing To	NV Card	Data being written to NV Media Card							
Data is being written to a NV Media Card to ensure that its copy of the drive parameters is correct because the drive is in Auto or Boot mode									
Waiting For	Power System	Waiting for power stage							
The drive is waiting for the processor in the power stage to respond after power-up									
Waiting For	Options	Waiting for an option module							
The drive is	waiting for the Option	s Modules to respond after power-up							
Uploading From	Options	Loading parameter database							
held by the o	drive because an optio	to update the parameter database on module has changed or because ested changes to the parameter							

an applications module has requested changes to the parameter structure. This may involve data transfer between the drive an option modules. During this period 'Uploading From Options' is displayed

13.8 Programming error indications

Following are the error message displayed on the drive keypad when an error occurs during programming of drive firmware.

Table 13-10 Programming error indications

Error String	Reason	Solution				
Error 1	There is not enough drive memory requested by all the option modules.	Power down drive and remove some of the option modules until the message disappears.				
Error 2	At least one option module did not acknowledge the reset request.	Power cycle drive				
Error 3	The boot loader failed to erase the processor flash	Power cycle drive and try again. If problem persists, return drive				
Error 4	The boot loader failed to program the processor flash	Power cycle drive and try again. If problem persists, return drive				
Error 5	One option module did not initialize correctly. Option module did not set Ready to Run flag.	Remove faulty option module.				

information installation installation started parameters the motor Optimization communication Operation PLC parameters Diagnostics information	Safety information	Product information	Mechanical installation	Electrical installation	Getting started	Basic parameters	Running the motor	Optimization	5	NV Media Card Operation		Advanced parameters	Diagnostics	UL information
--	-----------------------	------------------------	----------------------------	----------------------------	--------------------	---------------------	----------------------	--------------	---	----------------------------	--	------------------------	-------------	-------------------

13.9 Displaying the trip history

The drive retains a log of the last ten trips that have occurred. *Trip 0* (10.020) to *Trip 9* (10.029) store the most recent 10 trips that have occurred where *Trip 0* (10.020) is the most recent and *Trip 9* (10.029) is the oldest. When a new trip occurs it is written to *Trip 0* (10.020) and all the other trips move down the log, with oldest being lost. The date and time when each trip occurs are also stored in the date and time log, i.e. *Trip 0 Date* (10.041) to *Trip 9 Time* (10.060). The date and time are taken from *Date* (06.016) and *Time* (06.017). Some trips have sub-trip numbers which give more detail about the reason for the trip. If a trip has a sub-trip number its value is stored in the sub-trip log, i.e. *Trip 0 Sub-trip Number* (10.070) to *Trip 9 Sub-trip Number* (10.079). If the trip does not have a sub-trip number then zero is stored in the sub-trip log.

If any parameter between Pr **10.020** and Pr **10.029** inclusive is read by serial communication, then the trip number in Table 13-5 is the value transmitted.

NOTE

The trip logs can be reset by writing a value of 255 in Pr 10.038.

13.10 Behaviour of the drive when tripped

If the drive trips, the output of the drive is disabled so the load coasts to a stop. If any trip occurs the following read only parameters are frozen until the trip is cleared. This is to help in diagnose the cause of the trip.

Parameter	Description
01.001	Frequency / speed reference
01.002	Pre-skip filter reference
01.003	Pre-ramp reference
02.001	Post-ramp reference
03.001	Frequency slaving demand / Final speed ref
03.002	Speed feedback
03.003	Speed error
03.004	Speed controller output
04.001	Current magnitude
04.002	Active current
04.017	Reactive current
05.001	Output frequency
05.002	Output voltage
05.003	Power
05.005	DC bus voltage
07.001	Analog input 1*
07.002	Analog input 2*
07.003	Analog input 3*

*On Unidrive M700 / 701 only.

If the parameters are not required to be frozen then this can be disabled by setting bit 4 of Pr **10.037**.

14 UL information

14.1 UL file reference

All models are UL Listed to both Canadian and US requirements. The UL file reference is: NMMS/7.E171230. Products that incorporate the Safe Torque Off (STO) function are Certified for Functional Safety. The UL file reference is: FSPC.E171230.

14.2 Option modules, kits and accessories

Option Modules, Control Pods, Installation Kits and other accessories for use with these drives are UL Listed.

14.3 Enclosure ratings

With the exception of free-standing cubicle drives, all models are Open Type as supplied.

The drive enclosure is not classified as a fire enclosure. A separate fire enclosure must be provided. A UL/ NEMA Type 12 enclosure is suitable. Refer to relevant *Power Installation Guide for further information*.

When fitted with a conduit box the drives meet the requirements for UL Type 1. Type 1 enclosures are intended for indoor use, primarily to provide a degree of protection against limited amounts of falling dirt.

The drives meet the requirements for UL Type 12 when installed inside a Type 12 enclosure and through-hole mounted using the sealing kit and the high-IP insert (where provided).

When through-hole mounted, the drives have been evaluated as suitable for use in surrounding air temperatures up to 40 °C.

Remote Keypads are UL Type 12 when installed with the sealing washer and fixing kit provided.

When installed in a Type 1 or Type 12 enclosure, the drives may be operated in a compartment handling conditioned air. Refer to relevant *Power Installation Guide for further information*.

14.4 Mounting

Drives may be surface, through-panel or tile mounted using the appropriate brackets. Drives may be mounted singly or side by side with suitable space between them (bookcase mounting). Refer to relevant *Power Installation Guide for further information*.

14.5 Environment

Drives must be installed in a Pollution Degree 2 environment or better (dry, non-conductive pollution only).

The drives have been evaluated for use at ambient temperatures up to 40 °C. The drives have additionally been evaluated for 50 °C and 55 °C ambient air temperatures with a derated output. Refer to relevant *Power Installation Guide for further information*.

14.6 Electrical Installation

OVERVOLTAGE CATEGORY

OVC III

SUPPLY

The drives are suitable for use on a circuit capable of delivering not more than 100,000 RMS symmetrical amperes, 600 Volts AC Maximum.

TERMINAL TORQUE

Terminals must be tightened to the rated torque as specified in the Installation Instructions. Refer to relevant *Power Installation Guide for further information*.

WIRING TERMINALS

Drives must be installed using cables rated for 75 °C operation, copper wire only.

Where possible, UL Listed closed-loop connectors sized according to the field wiring shall be used for all field power wiring connections. Refer to relevant *Power Installation Guide for further information*.

GROUND CONNECTION INSTRUCTIONS

UL Listed closed-loop connectors sized according to the field wiring shall be used for grounding connections. Refer to relevant *Power Installation Guide for further information*.

BRANCH CIRCUIT PROTECTION

The fuses and circuit breakers required for branch circuit protection are specified in the Installation Instructions. Refer to relevant *Power Installation Guide for further information*.

OPENING OF BRANCH CIRCUIT

Opening of the branch-circuit protective device may be an indication that a fault has been interrupted. To reduce the risk of fire or electric shock, the equipment should be examined and replaced if damaged. If burnout of the current element of an overload relay occurs, the complete overload relay must be replaced.

Integral solid state short circuit protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the National Electrical Code (NEC), The Canadian Electrical Code, and any additional local codes.

information	information	installation	installation	started	parameters	the motor	Optimization	communication	Operation	PLC	parameters	Diagnostics	information

REGENERATIVE OPERATION

Drives can be configured as an AC Regenerative Unit (also known as a Regen drive). Regen operation allows bi-directional power flow to and from the AC supply. The AC supply voltage must not exceed 600 Vac. Contact the supplier of the drive for more information on building a Regen system.

14.7 Motor overload protection and thermal memory retention

All drives incorporate internal overload protection for the motor load that does not require the use of an external or remote overload protection device.

The protection level is adjustable and the method of adjustment is provided in section 8.4 *Motor thermal protection* on page 108. Maximum current overload is dependent on the values entered into the current limit parameters (motoring current limit, regenerative current limit and symmetrical current limit entered as percentage) and the motor rated current parameter (entered in amperes).

The duration of the overload is dependent on motor thermal time constant. The maximum programmable time constant depends on the drive model. The method of adjustment of the overload protection is provided. Refer to the relevant *Power Installation Guide for further information*.

The drives are provided with user terminals that can be connected to a motor thermistor to protect the motor from high temperature, in the event of a motor cooling fan failure. Refer to the relevant *Power Installation Guide for further information*.

14.8 External Class 2 supply

The external power supply used to power the 24 V control circuit shall be marked: "UL Class 2". The power supply voltage shall not exceed 24 Vdc. Refer to the relevant Power Installation Guide for further information.

14.9 Modular Drive Systems

Drives with DC+ and DC- supply connections, rated 230 V or 480 V have been investigated for use in Modular Drive Systems as inverters when supplied by the converter sections from the Unidrive-M range. In these applications the inverters are required to be additionally protected by supplemental fuses.

Alternatively, the inverters may be supplied by converter models: Mentor MP25A, 45A, 75A, 105A, 155A or 210A.

Modular drives with frame sizes 9, 10 and 11 are not certified for Canada when used in a modular/parallel setup without DC fuses.

Contact the supplier of the drive for more information.

14.10 Requirement for Transient Surge Suppression

This requirement only applies to Frame Size 7 drives with rated input voltage = 575 V.

TRANSIENT SURGE SUPPRESSION SHALL BE INSTALLED ON THE LINE SIDE OF THIS EQUIPMENT AND SHALL BE RATED 575 Vac (PHASE TO GROUND), 575 Vac (PHASE TO PHASE), SUITABLE FOR OVERVOLTAGE CATEGORY III, AND SHALL PROVIDE PROTECTION FOR A RATED IMPULSE VOLTAGE TO WITHSTAND VOLTAGE PEAK OF 6 kV AND A CLAMPING VOLTAGE OF MAXIMUM 2400 V.
